Appendix A
TRIP GENERATION BY ALTERNATIVE

The trip generation used in the South County Sub-Area Model (SCSAM) is based on socioeconomic data to provide consistency with the Orange County Transportation Analysis Model (OCTAM). The consistency guidelines for subarea models require reasonable agreement with respect to trip generation and recommend the use of the same socioeconomic variables as in the parent model to assure such consistency. Detailed information on trip generation rates, land use/socioeconomic data conversion and related topics can be found in the SCSAM documentation. In the information which follows, tables are presented showing the land use data for each project alternative, the conversion to socioeconomic data, and the resulting trip generation. As a reference for the trip generation calculations, Table A-1 lists the socioeconomic trip generation rates and Table A-2 lists the land use to socioeconomic data conversion factors. The tables which follow provide the relevant data for the following alternatives:

Short-Range (2010) Proposed Project (5,000 DU)
Proposed Project (B-4)
B-4 Reduced Intensity Alternative
B-5 Alternative
B-6 Alternative
B-8 Alternative
Current County General Plan Zoning (Existing Zoning Alternative)
OCP-2000 Alternative
Regional Housing Alternative
County Constrained Alternative

Appendix B
TRAFFIC DATA BY ALTERNATIVE

This appendix contains long-range (2025) traffic forecast data for the following project alternatives and circulation system scenarios:

No Project (Committed Circulation System)
Existing Zoning Alternative (Committed Circulation System)
Existing Zoning Alternative (MPAH Buildout)
OCP-2000 Alternative (MPAH Buildout)
B-4 Reduced Intensity Alternative (Committed Circulation System)
B-4 Reduced Intensity Alternative (Committed Circulation System Plus La Pata)
B-4 Reduced Intensity Alternative (Committed Circulation System Plus La Pata and FTC-S)
B-5 Alternative (Committed Circulation System)
B-5 Alternative (Committed Circulation System Plus La Pata)
B-5 Alternative (Committed Circulation System Plus La Pata and FTC-S)
Regional Housing Alternative (Committed Circulation System Plus La Pata and FTC-S)

The information provided for each scenario includes an ADT volume diagram, a peak hour intersection capacity utilization (ICU) summary table (actual ICU worksheets can be found in Appendix C), a peak hour freeway ramp level of service (LOS) summary table, and a peak hour freeway mainline LOS summary table.

29. Antonio/La Pata & Ortega (b)	1.60	F	1.37	F

Abbreviations: ICU - intersection capacity utilization
LOS - level of service
NB - northbound
SB - southbound

(a) LOS E is acceptable at this location (Congestion Management Program (CMP) intersections and Crown Valley Parkway intersections between I-5 and Marguerite Parkway). LOS D is the adopted performance standard for all other intersection locations that are analyzed.

(b) This location is forecast to operate deficiently in the AM and/or PM peak hour (i.e., the LOS is worse than the adopted LOS performance standard).

Abbreviations: ICU - intersection capacity utilization
LOS - level of service
NB - northbound
SB - southbound

(a) LOS E is acceptable at this location (Congestion Management Program (CMP) intersections and Crown Valley Parkway intersections between I-5 and Marguerite Parkway). LOS D is the adopted performance standard for all other intersection locations that are analyzed.

(b) This location is forecast to operate deficiently in the AM and/or PM peak hour (i.e., the LOS is worse than the adopted LOS performance standard).

Abbreviations: ICU - intersection capacity utilization
LOS - level of service
NB - northbound
SB - southbound

(a) LOS E is acceptable at this location (Congestion Management Program (CMP) intersections and Crown Valley Parkway intersections between I-5 and Marguerite Parkway). LOS D is the adopted performance standard for all other intersection locations that are analyzed.

(b) This location is forecast to operate deficiently in the AM and/or PM peak hour (i.e., the LOS is worse than the adopted LOS performance standard).

87. F St & C St	.83	D	.76	C
89. F St & New Ortega	.88	D	.86	D

Abbreviations: ICU - intersection capacity utilization
LOS - level of service
NB - northbound
SB - southbound

(a) LOS E is acceptable at this location (Congestion Management Program (CMP) intersections and Crown Valley Parkway intersections between I-5 and Marguerite Parkway). LOS D is the adopted performance standard for all other intersection locations that are analyzed.

(b) This location is forecast to operate deficiently in the AM and/or PM peak hour (i.e., the LOS is worse than the adopted LOS performance standard).

2025 Freeway Ramp LOS Summary
- B-5 Alternative (Committed Circulation System with La Pata)

Abbreviations: ICU - intersection capacity utilization
LOS - level of service
NB - northbound
SB - southbound

(a) LOS E is acceptable at this location (Congestion Management Program (CMP) intersections and Crown Valley Parkway intersections between I-5 and Marguerite Parkway). LOS D is the adopted performance standard for all other intersection locations that are analyzed.

(b) This location is forecast to operate deficiently in the AM and/or PM peak hour (i.e., the LOS is worse than the adopted LOS performance standard).

Abbreviations: ICU - intersection capacity utilization
LOS - level of service
NB - northbound
SB - southbound

(a) LOS E is acceptable at this location (Congestion Management Program (CMP) intersections and Crown Valley Parkway intersections between I-5 and Marguerite Parkway). LOS D is the adopted performance standard for all other intersection locations that are analyzed.

(b) This location is forecast to operate deficiently in the AM and/or PM peak hour (i.e., the LOS is worse than the adopted LOS performance standard).

Appendix C
INTERSECTION CAPACITY UTILIZATION WORKSHEETS

This appendix contains information pertaining to the existing and future intersection analysis portion of the Ranch Plan traffic study. A summary of the existing and future lane geometric configurations for the intersections that are analyzed is provided in Table C-1, and the sections that follow contain existing and future AM and PM peak hour intersection capacity utilization (ICU) worksheets for intersections in the traffic analysis study area. For intersections that are impacted by the proposed project, ICU worksheets with and without mitigation are included. The ICU data sets contained in this appendix are presented in the following order:

ICU DATA SETS

ICU DATA SETS (cont)

ICU Calculation Methodology

The ICU procedure is based on the critical movement methodology, and shows the amount of capacity utilized by each critical move. For City of San Clemente intersections, a capacity of 1,600 vehicles per hour (VPH) per lane is assumed with no clearance interval. For intersections in all other jurisdictions in the study area, a capacity of 1700 VPH per lane is assumed together with a .05 clearance interval. A "de-facto" right-turn lane is used in the ICU calculation for cases where a curb lane is wide enough to separately serve both thru and right-turn traffic (typically with a width of 19 feet from curb to outside of thru-lane with parking prohibited during peak periods). Such lanes are treated the same as striped right-turn lanes during the ICU calculations, but they are denoted on the ICU calculation worksheets using the letter "d" in place of a numerical entry for right-turn lanes.

The methodology also incorporates a check for right-turn capacity utilization. Both right-turn-on-green (RTOG) and right-turn-on-red (RTOR) capacity availability are calculated and checked against the total right-turn capacity need. If insufficient capacity is available, then an adjustment is made to the total capacity utilization value. The following example shows how this adjustment is made.

Example For Northbound Right

1. Right-Turn-On-Green (RTOG)

If NBT is critical move, then:
RTOG = V/C (NBT)
Otherwise,
RTOG = V/C (NBL) + V/C (SBT) - V/C (SBL)

2. Right-Turn-On-Red (RTOR)

If WBL is critical move, then:
RTOR = V/C (WBL)
Otherwise,
RTOR = V/C (EBL) + V/C (WBT) - V/C (EBT)

3. Right-Turn Overlap Adjustment

If the northbound right is assumed to overlap with the adjacent westbound left, adjustments to the RTOG and RTOR values are made as follows:

RTOG = RTOG + V/C (WBL)
RTOR = RTOR - V/C (WBL)

4. Total Right-Turn Capacity (RTC) Availability For NBR

RTC = RTOG + factor x RTOR
Where factor = RTOR saturation flow factor (0% for County intersections, 75% for intersections in all other jurisdictions in the study area)

Right-turn adjustment is then as follows: Additional ICU = V/C (NBR) - RTC

A zero or negative value indicates that adequate capacity is available and no adjustment is necessary. A positive value indicates that the available RTOR and RTOG capacity does not adequately accommodate the right-turn V/C, therefore the right-turn is essentially considered to be a critical movement. In such cases, the right-turn adjustment is noted on the ICU worksheet and it is included in the total capacity utilization value. When it is determined that a right-turn adjustment is required for more than one right-turn movement, the word "multi" is printed on the worksheet instead of an actual right-turn movement reference, and the right-turn adjustments are cumulatively added to the total capacity utilization value. In such cases, further operational evaluation is typically carried out to determine if under actual operational conditions, the critical right-turns would operate simultaneously, and therefore a right-turn adjustment credit should be applied.

Shared Lane V/C Methodology

For intersection approaches where shared usage of a lane is permitted by more than one turn movement (e.g., left/thru, thru/right, left/thru/right), the individual turn volumes are evaluated to determine whether dedication of the shared lane is warranted to any one given turn movement. The following example demonstrates how this evaluation is carried out:

Example for Shared Left/Thru Lane

1. Average Lane Volume (ALV)

$$ALV = \frac{\text{Left-Turn Volume + Thru Volume}}{\text{Total Left + Thru Approach Lanes (including shared lane)}}$$

2. ALV for Each Approach

$$\text{ALV (Left)} = \frac{\text{Left-Turn Volume}}{\text{Left Approach Lanes (including shared lane)}}$$

$$\text{ALV (Thru)} = \frac{\text{Thru Volume}}{\text{Thru Approach Lanes (including shared lane)}}$$

3. Lane Dedication is Warranted

If ALV (Left) is greater than ALV then full dedication of the shared lane to the left-turn approach is warranted. Left-turn and thru V/C ratios for this case are calculated as follows:

$$\text{V/C (Left)} = \frac{\text{Left-Turn Volume}}{\text{Left Approach Capacity (including shared lane)}}$$

$$\text{V/C (Thru)} = \frac{\text{Thru Volume}}{\text{Thru Approach Capacity (excluding shared lane)}}$$

Similarly, if ALV (Thru) is greater than ALV then full dedication to the thru approach is warranted, and left-turn and thru V/C ratios are calculated as follows:

$$\text{V/C (Left)} = \frac{\text{Left-Turn Volume}}{\text{Left Approach Capacity (excluding shared lane)}}$$

$$\text{V/C (Thru)} = \frac{\text{Thru Volume}}{\text{Thru Approach Capacity (including shared lane)}}$$

4. Lane Dedication is not Warranted

If ALV (Left) and ALV (Thru) are both less than ALV, the left/thru lane is assumed to be truly shared and each left, left/thru or thru approach lane carries an evenly distributed volume of traffic equal to ALV. A combined left/thru V/C ratio is calculated as follows:

$$\text{V/C (Left/Thru)} = \frac{\text{Left-Turn Volume + Thru Volume}}{\text{Total Left + Thru Approach Capacity (including shared lane)}}$$

This V/C (Left/Thru) ratio is assigned as the V/C (Thru) ratio for the critical movement analysis and ICU summary listing.

If split phasing has not been designated for this approach, the relative proportion of V/C (Thru) that is attributed to the left-turn volume is estimated as follows:

If approach has more than one left-turn (including shared lane), then:

$$\text{V/C (Left)} = \text{V/C (Thru)}$$

If approach has only one left-turn lane (shared lane), then:

$$\text{V/C (Left)} = \frac{\text{Left-Turn Volume}}{\text{Single Approach Lane Capacity}}$$

If this left-turn movement is determined to be a critical movement, the V/C (Left) value is posted in brackets on the ICU summary printout.

These same steps are carried out for shared thru/right lanes. If full dedication of a shared thru/right lane to the right-turn movement is warranted, the right-turn V/C value calculated in step three is checked against the RTOR and RTOG capacity availability if the option to include right-turns in the V/C ratio calculations is selected. If the V/C value that is determined using the shared lane methodology described here is reduced due to RTOR and RTOG capacity availability, the V/C value for the thru/right lanes is posted in brackets.

When an approach contains more than one shared lane (e.g., left/thru and thru/right), steps one and two listed above are carried out for the three turn movements combined. Step four is carried out if dedication is not warranted for either of the shared lanes. If dedication of one of the shared lanes is warranted to one movement or another, step three is carried out for the two movements involved, and then steps one through four are repeated for the two movements involved in the other shared lane.

Appendix D
HIGHWAY CAPACITY MANUAL (HCM) INTERSECTION LOS WORKSHEETS

This appendix contains peak hour level of service (LOS) worksheets for Caltrans intersections based on 2025 cumulative with project (Ranch Plan) conditions with La Pata Avenue and the Foothill Transportation Corridor South (FTC-S) and with project mitigation. The worksheets in this appendix are based on the Highway Capacity Manual (HCM) methodology for calculating peak hour intersection LOS.

Intersection Summary

Area Type: Other
Cycle Length: 70
Actuated Cycle Length: 70
Offset: 48 (69%), Referenced to phase 2:NBT and 6:, Start of Green
Natural Cycle: 55
Control Type: Actuated-Coordinated
Maximum v/c Ratio: 0.93
Intersection Signal Delay: 16.0 Intersection LOS: B
Intersection Capacity Utilization 82.2% ICU Level of Service E
Analysis Period (min) 15
95th percentile volume exceeds capacity, queue may be longer.
Queue shown is maximum after two cycles.
m Volume for 95th percentile queue is metered by upstream signal.

Intersection Summary

Area Type: Other
Cycle Length: 90
Actuated Cycle Length: 90
Offset: 18 (20%), Referenced to phase 2: and 6:SBTL, Start of Green
Natural Cycle: 80
Control Type: Actuated-Coordinated
Maximum v/c Ratio: 0.92
Intersection Signal Delay: 35.4 Intersection LOS: D
Intersection Capacity Utilization 114.6% ICU Level of Service H
Analysis Period (min) 15
95th percentile volume exceeds capacity, queue may be longer.
Queue shown is maximum after two cycles.
m Volume for 95th percentile queue is metered by upstream signal.

Splits and Phases: 9: AVERY PKWY & I-5 S/B OFF RAMP

Intersection Summary

Area Type: Other
Cycle Length: 70
Actuated Cycle Length: 70
Offset: 0 (0%), Referenced to phase 2: and 6:SBL, Start of Green
Natural Cycle: 55
Control Type: Actuated-Coordinated
Maximum v/c Ratio: 0.98
Intersection Signal Delay: 24.6 Intersection LOS: C
Intersection Capacity Utilization 76.9% ICU Level of Service D
Analysis Period (min) 15
95th percentile volume exceeds capacity, queue may be longer.
Queue shown is maximum after two cycles.
dl Defacto Left Lane. Recode with 1 though lane as a left lane.

Intersection Summary

Area Type:	Other		
Cycle Length: 50			
Actuated Cycle Length: 49.3			
Natural Cycle: 65			
Control Type: Semi Act-Uncoord			
Maximum v/c Ratio: 0.92			
Intersection Signal Delay: 22.4		Intersection LOS: C	
Intersection Capacity Utilization 80.7%		ICU Level of Service D	
Analysis Period (min) 15			

\# 95th percentile volume exceeds capacity, queue may be longer.
Queue shown is maximum after two cycles.

Chapter 1.0
INTRODUCTION

This traffic study addresses the traffic impacts of the proposed Ranch Plan in unincorporated south Orange County. It has been prepared to provide the traffic and circulation material for the overall project Environmental Impact Report (EIR).

BACKGROUND AND SCOPE

The proposed Ranch Plan involves development in portions of a 22,815 acre area in south Orange County. Figure 1-1 illustrates the location of the project site. The proposed project will develop 14,000 residential dwelling units, plus non-residential uses such as schools, retail centers and business parks on around 8,000 acres. The remainder will be permanent open space.

The scope of work for this traffic study is intended to satisfy the traffic impact analysis requirements of a General Plan Amendment (GPA)/Zone Change (ZC) and development agreement approval. The overall approach can be summarized as follows:

1. Existing Plus Project Analysis: In this part of the traffic study, the project is analyzed in relation to existing conditions (i.e., existing versus existing plus project).

2. Long-Range/Cumulative Impact Analysis: This part of the analysis addresses the proposed project plus cumulative projects using a long-range (year 2025) time frame.

3. Short-Range Analysis: This examines circulation under a short-range (2010) setting based on the level of project development anticipated by 2010.

Chapter 2.0 of this report provides the transportation setting for the impact analysis, and Chapter 3.0 provides a description of the proposed project and project alternatives. Chapter 4.0 then focuses on the potential traffic impacts of the project on existing conditions and the long-term traffic impacts of the project together with cumulative projects. Chapter 5.0 presents transportation improvements to mitigate the project impacts and the cumulative impacts. Chapter 6.0 then discusses short-term project impacts, and Chapter 7.0 analyzes selected project alternatives. Chapter 8.0 addresses a number of special issues.

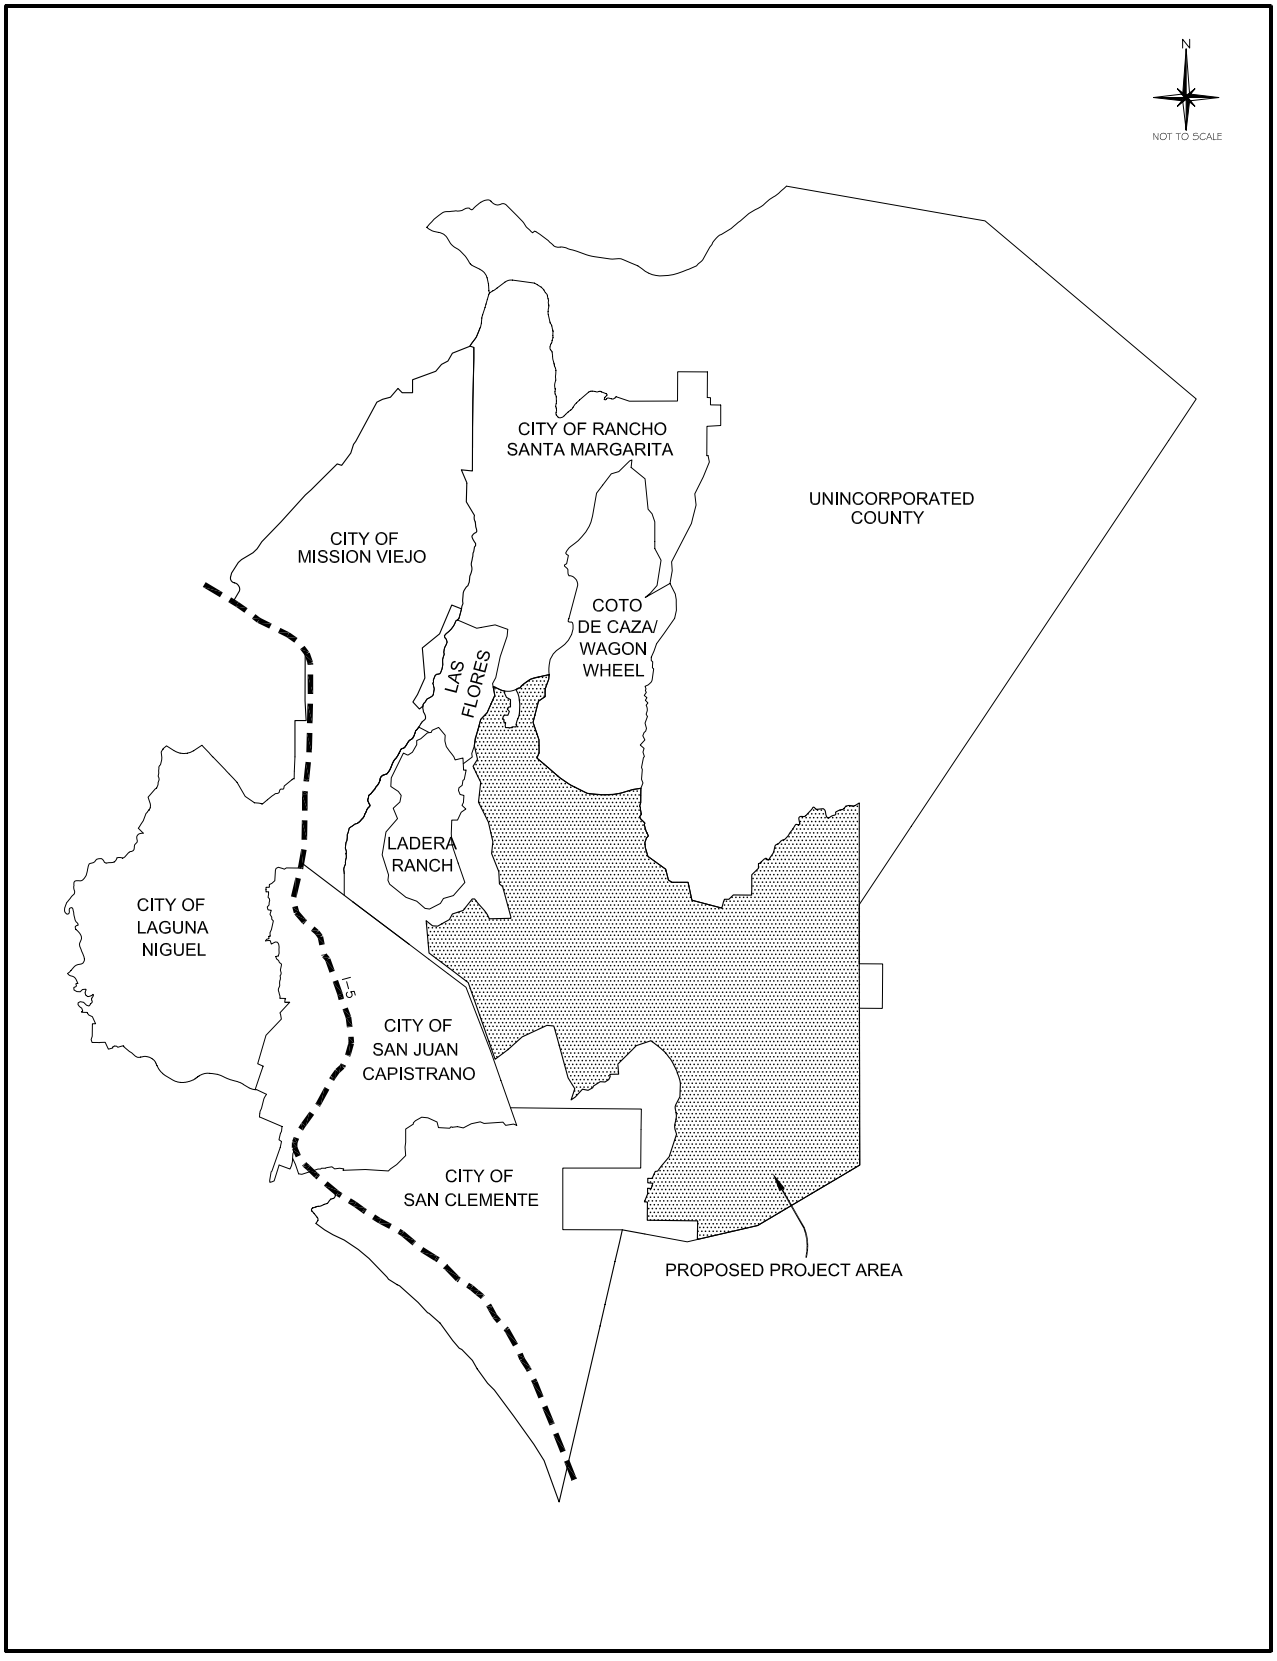

Figure 1-1

PROJECT SITE LOCATION

METHODOLOGY AND ASSUMPTIONS

This section discusses the overall methodology used in the traffic study. It describes the study area, the traffic forecasting methodology, the performance criteria used in evaluating alternatives, and the basic assumptions applied in the analysis.

Traffic Analysis Study Area

Figure 1-2 illustrates the study area for the traffic analysis. It encompasses all or portions of a number of incorporated cities in south Orange County including the Cities of Mission Viejo, San Juan Capistrano and San Clemente, and also parts of the Cities of Rancho Santa Margarita, Laguna Hills, and Laguna Niguel. Also included is the unincorporated part of Orange County from Rancho Santa Margarita to San Clemente which encompasses the communities of Las Flores, Ladera Ranch, Coto de Caza and Talega and the project area. The following specific criteria were used in defining this study area.

- For arterial roads, the study area includes all facilities where peak hour intersection volume/capacity ratios increase by one percent or more as a result of the project. This is the impact threshold designated in the Growth Management Element of the Orange County General Plan.

- For freeways, the study area includes all facilities where peak hour volumes increase by more than three percent as a result of the project. This is the impact threshold designated in the Orange County Congestion Management Program (CMP).

Traffic Forecasting Methodology

Traffic forecast data for the analysis was prepared using the South (Orange) County Sub-Area Model (SCSAM). This traffic forecasting model is a focused sub-area model derived from the Orange County Transportation Analysis Model (OCTAM) and was specifically designed to provide detailed forecasting capability within the study area. The SCSAM is based on OCTAM Version 3.1 (OCTAM 3.1) which was adopted by the Orange County Transportation Authority (OCTA) in June 2001 together with a set of sub-area model consistency guidelines, which are outlined in the *Orange County Subarea Modeling Guidelines Manual* (Orange County Transportation Authority, June 2001). The SCSAM has been certified by the OCTA as being in compliance with these guidelines. For a complete description of the SCSAM, refer to the *SCSAM Traffic Model Description and Validation Report* (Reference 4 at the end of this chapter).

Figure 1-2

STUDY AREA

The traffic forecast data produced by the SCSAM includes average daily traffic (ADT) volumes for arterial roadway and freeway/tollway mainline segments, and AM and PM peak hour volumes for intersection locations on the arterial and freeway/tollway circulation network, freeway ramps, and freeway mainline segments.

The traffic model description and validation report provides statistical data regarding the ability of the model to replicate existing traffic conditions in the traffic analysis study area. The purpose of that information is to show a model validation that achieves certain criteria with respect to the comparison between modeled traffic volumes and actual traffic counts. While the confidence intervals derived from those accuracy levels are a general measure of the corresponding accuracy or uncertainty of the model for forecasting purposes, they are applicable only to new roadways in the study area. Existing roadways, which comprise most of the study area circulation system, have future volumes derived as part of a post-processing step in which existing traffic count data in combination with traffic model data is used to produce the future traffic forecasts. The accuracy limitations of the traffic model therefore apply only to the growth in traffic between existing and future conditions (i.e., the part that is actually "modeled"). For example, a confidence interval of 15 percent would translate to a forecast confidence interval of six percent for a facility with 40 percent traffic growth in the future (15 x 0.40 = 6).

PERFORMANCE CRITERIA

In traffic impact studies, impact criteria are based on two primary measures. The first is "capacity" which establishes the vehicle carrying ability of a road segment and the second is "volume." The volume measure is either a traffic count (in the case of existing volumes) or a traffic forecast for a future point in time. The ratio between the volume and the capacity gives a volume/capacity (V/C) ratio and based on that V/C ratio, a corresponding level of service (LOS) is defined. Traffic LOSs are designated A through F with LOS A representing free flow conditions and LOS F representing severe traffic congestion. Traffic flow quality for the different LOSs is described in Table 1-1.

Table 1-2 summarizes the V/C ranges that correspond to LOSs A through F for arterial roads and freeway segments. The V/C ranges listed for arterial roads are designated in the Orange County CMP and are also utilized by the County of Orange and by the local jurisdictions in the study area. The V/C ranges listed for freeway segments are based on the V/C and LOS relationships specified in the *Highway Capacity Manual 2000* (HCM 2000) (see Reference 1 at the end of this chapter) for basic freeway sections with free-flow speeds of 105 kilometers per hour (65 miles per hour).

Table 1-1

LEVEL OF SERVICE DESCRIPTIONS

LOS	Arterial Roads	Freeway Segments
A	Describes primarily free-flow operations at average travel speeds, usually about 90 percent of the free-flow speed for the given street class. Vehicles are completely unimpeded in their ability to maneuver within the traffic stream. Control delay at signalized intersections is minimal.	Describes free-flow operations. Free-flow speeds prevail. Vehicles are almost completely unimpeded in their ability to maneuver within the traffic stream. The effects of incidents or point breakdowns are easily absorbed at this level.
B	Describes reasonably unimpeded operations at average travel speeds, usually about 70 percent of the free-flow speed for the street class. The ability to maneuver within the traffic stream is only slightly restricted, and control delays at signalized intersections are not significant.	Represents reasonably free flow, and free-flow speeds are maintained. The ability to maneuver within the traffic stream is only slightly restricted, and the general level of physical and psychological comfort provided to drivers is still high. The effects of minor incidents and point breakdowns are still easily absorbed.
C	Describes stable operations; however, ability to maneuver and change lanes in midblock locations may be more restricted than at LOS B, and longer queues, adverse signal coordination, or both may contribute to lower average travel speeds of about 50 percent of the free-flow speed for the street class.	Provides for flow with speeds at or near the free-flow speed of the freeway. Freedom to maneuver within the traffic stream is noticeably restricted, and lane changes require more care and vigilance on the part of the driver. Minor incidents may still be absorbed, but the local deterioration in service will be substantial. Queues may be expected to form behind any significant blockage.
D	Borders on a range in which small increases in flow may cause substantial increases in delay and decreases in travel speed. LOS D may be due to adverse signal progression, inappropriate signal timing, high volumes, or a combination of these factors. Average travel speeds are about 40 percent of free-flow speed.	The level at which speeds begin to decline slightly with increasing flows and density begins to increase somewhat more quickly. Freedom to maneuver within the traffic stream is more noticeably limited, and the driver experiences reduced physical and psychological comfort levels. Even minor incidents can be expected to create queuing, because the traffic stream has little space to absorb disruptions.

Table 1-1 (cont)
LEVEL OF SERVICE DESCRIPTIONS

LOS	Arterial Roads	Freeway Segments
E	Characterized by significant delays and average travel speeds of 33 percent or less of the free-flow speed. Such operations are caused by a combination of adverse signal progression, high signal density, high volumes, extensive delays at critical intersections, and inappropriate signal timing.	At its highest density value, LOS E describes operation at capacity. Operations at this level are volatile, because there are virtually no usable gaps in the traffic stream. Vehicles are closely spaced, leaving little room to maneuver within the traffic stream at speeds that still exceed 49 miles per hour. Any disruption of the traffic stream, such as vehicles entering from a ramp or a vehicle changing lanes, can establish a disruption wave that propagates throughout the upstream traffic flow. At capacity, the traffic stream has no ability to dissipate even the most minor disruption, and any incident can be expected to produce a serious breakdown with extensive queuing. Maneuverability within the traffic stream is extremely limited, and the level of physical and psychological comfort afforded the driver is poor.
F	Characterized by urban street flow at extremely low speeds, typically one-third to one-fourth of the free-flow speed. Intersection congestion is likely at critical signalized locations, with high delays, high volumes, and extensive queuing.	Describes breakdowns in vehicular flow. Such conditions generally exist within queues forming behind breakdown points. LOS F operations within a queue are the result of a breakdown or bottleneck at a downstream point. LOS F is also used to describe conditions at the point of the breakdown or bottleneck and the queue discharge flow that occurs at speeds lower than the lowest speed for LOS E, as well as the operations within the queue that forms upstream. Whenever LOS F conditions exist, they have the potential to extend upstream for significant distances.

Table 1-2

VOLUME/CAPACITY RATIO LEVEL OF SERVICE RANGES

Level of Service (LOS)	-------- Volume/Capacity (V/C) Ratio Range (a) -------- Arterial Roads and Intersections	Freeway Segments
A	0.00 – 0.60	0.00 – 0.30
B	0.61 – 0.70	0.31 – 0.50
C	0.71 – 0.80	0.51 – 0.71
D	0.81 – 0.90	0.72 – 0.89
E	0.91 – 1.00	0.90 – 1.00
F	Above 1.00	Above 1.00

(a) Sources are as follows:

Arterial road and intersection V/C ranges: 2003 Orange County Congestion Management Program, Orange County Transportation Authority.

Freeway segment V/C ranges: Highway Capacity Manual 2000 (HCM 2000), Transportation Research Board, National Research Council.

Both the V/C ratio and the LOS are used in identifying impacts. Certain LOS values are deemed acceptable by the various governing jurisdictions within the traffic analysis study area and increases in the V/C ratio which cause or contribute to the LOS being unacceptable are defined as an adverse impact.

In establishing V/C based performance criteria, there are specific procedures used to obtain suitable V/C estimates and relate them to LOS. For instance, while ADT is a useful measure to show general levels of traffic on a facility and to provide data for other related analyses such as noise and air quality, ADT is not used in this analysis as the basis for capacity evaluation. The reason is that traffic congestion is largely a peak hour or peak period occurrence and ADT does not reflect peak conditions very effectively. As a result, this evaluation focuses on those parts of the day when such congestion typically occurs.

The impact criteria are separated according to three fundamental components of the circulation system, freeway mainline segments, freeway ramps, and arterial roads. Peak hour data (AM and PM) is used in all cases to establish V/C and LOS measures and to define what constitutes an adverse traffic impact. The following sections describe the impact criteria (i.e., V/C calculation methodology, LOS performance standards, and traffic impact thresholds) for the three circulation system components.

Impact Criteria For Freeway Mainline Segments

The impact analysis for freeway mainline segments is based on peak hour volumes by direction. When a peak hour V/C ratio for a freeway segment exceeds the theoretical (and practical) maximum V/C of 1.0, the actual value is reported, even though it is recognized that this demand typically cannot be accommodated during the peak hour. In such cases the excess peak hour demand will spread into a peak period that lasts more than one hour, as vehicles queue back from the bottleneck area. Also, when this occurs on a regular basis, many motorists will try to avoid the peak hours by traveling before or after the peak hours. The degree to which spreading into the peak period occurs is considered in the traffic forecasting process but is not used in the actual performance. This is discussed in some detail in Chapter 2.0 under existing conditions.

Capacities for calculating peak hour V/C ratios for freeway mainline segments are based on information contained in the *Highway Design Manual* (Caltrans, July 1995) and have been verified by Caltrans staff in previous Orange County studies. A capacity of 2,000 vehicles per hour per lane (vphpl)

is used for mixed-flow (general purpose) mainline freeway lanes, a capacity that corresponds to LOS E conditions. Consistent with Caltrans' guidelines for high occupancy vehicle (HOV) facilities, a desirable operating capacity of 1,600 vphpl is applied for a one-lane buffer-separated HOV facility and a desirable operating capacity of 1,750 vphpl is applied for a two-lane buffer-separated HOV facility in which passing is allowed. These HOV capacities, which are lower than the capacity for a mixed-flow freeway lane, reflect Caltrans' objective for HOV facilities to operate better than LOS E.

The capacity of a freeway auxiliary lane is generally different from that of a mainline lane because auxiliary lanes are typically implemented to preserve standard freeway capacities at locations where the geometric design is below standard (for example, between interchanges that are spaced less than 1.6 kilometers (1.0 miles) apart) or where heavy on/off ramp volumes occur between interchanges. While an auxiliary lane can increase the overall capacity of a mainline freeway segment, the practical increase depends on factors such as the length of the auxiliary lane and the on/off ramp volumes at the beginning and end of the auxiliary lane.

The capacity assumptions for freeway mixed-flow, HOV and auxiliary lanes are summarized in Table 1-3 together with the overall impact criteria for analyzing freeway mainline segments within the study area. When evaluating existing freeway conditions (i.e., based on traffic count data), the V/C and LOS criteria are applicable only in situations where the observed traffic volume occurs in stable flow. Freeway capacities can be substantially reduced under unstable congested conditions in which less traffic is accommodated than under ideal freeway operating conditions. The LOS E performance standard listed in Table 1-3 has been established by Caltrans as the operating standard for freeway mainline segments and is also consistent with the LOS standard specified in the Orange County CMP for CMP facilities.

Impact Criteria For Arterial Roads

For the arterial roadway system, the peak hour is the time period used for impact evaluation and a number of techniques are available to establish suitable V/C ratios and to define the corresponding LOSs. These definitions and procedures are established by individual local jurisdictions or by regional programs such as the CMP and the countywide Growth Management Plan (GMP).

For the Ranch Plan traffic impact study, the analysis of the arterial road system is based on intersection capacity because this is the defining capacity limitation on an arterial highway system. There

Table 1-3

FREEWAY MAINLINE PERFORMANCE CRITERIA

V/C Calculation Methodology

Level of service to be based on peak hour volume/capacity (V/C) ratios calculated using the following capacities:

2,000 vehicles per hour per lane (vphpl) for mixed-flow (general purpose) lanes.

1,600 vphpl for a one-lane buffer-separated high occupancy vehicle (HOV) facility.

1,750 vphpl for a two-lane buffer-separated HOV facility.

0 vehicles per hour (vph) added capacity for an auxiliary lane that is 0.8 km (0.5 mile) or less in length, an auxiliary lane that is between 0.8 km (0.5 mile) and 1.6 km (1.0 mile) in length carrying less than 1,000 vph of total on/off ramp volume at the beginning and end of the lane, or an auxiliary lane that acts as a climbing lane.

500 vph added capacity for an auxiliary lane that is between 0.8 km (0.5 mile) and 1.6 km (1.0 mile) in length carrying between 1,000 and 2,000 vph of total on/off ramp volume at the beginning and end of the lane.

1,000 vph added capacity for an auxiliary lane that is between 0.8 km (0.5 mile) and 1.6 km (1.0 mile) in length carrying more than 2,000 vph of total on/off ramp volume at the beginning and end of the lane.

2,000 vph added capacity for an auxiliary lane that is more than 1.6 km (1.0 mile) in length.

Performance Standard

Level of Service E (peak hour V/C less than or equal to 1.00).

Impact Threshold

A freeway mainline segment is considered to be adversely impacted if:

1. The segment is forecast to operate deficiently (i.e., worse than the performance standard).

2. The V/C in a project alternative increases by greater than 0.03 (the impact threshold specified in the CMP) compared to the V/C in no-project alternative.

Abbreviations: CMP – Orange County Congestion Management Program

may be exceptions where certain facilities have long distances between signalized intersections, but within the traffic analysis study area, peak hour intersection performance is the most representative measure for evaluating the arterial road system. Levels of service for arterial road intersections are determined based on operating conditions during the AM and PM peak hours. The intersection capacity utilization (ICU) methodology is applied based on peak hour volumes and a given intersection's geometric configuration. This methodology sums the V/C ratios for the critical movements of an intersection and is generally compatible with the intersection capacity analysis methodology in the *HCM 2000*. The ICU ranges that correspond to LOSs A through F are the same as the V/C ranges shown previously in Table 1-2 for arterial roads and intersections.

The jurisdictions in the study area have established arterial intersection LOS standards that serve both as a guideline for evaluating observed traffic conditions and as a target or goal when evaluating future development plans and circulation system modifications. The jurisdictions within the traffic analysis study area have also adopted various parameters for calculating ICU values and thresholds for identifying adverse ICU impacts.

The ICU calculation methodology and associated impact criteria applied for the study area arterial system are summarized in Table 1-4. Most local jurisdictions in the study area utilize LOS D (ICU not to exceed 0.90) as the accepted standard. Exceptions are noted in the table for local jurisdictions that accept a different LOS standard for a certain section of road and for CMP locations that have a different LOS standard.

Impact Criteria For Freeway Ramps

Similar to the arterial system evaluation, the peak hour is the time period standardly used by Caltrans for impact evaluation of freeway interchange ramps. For the Ranch Plan traffic study, levels of service for freeway ramps in the traffic analysis study area are based on AM and PM peak hour V/C ratios. Carrying capacities for the various ramp configurations that either exist or are anticipated on the freeway system in the traffic analysis study area are based on information in the *Highway Design Manual* (Caltrans, July 1995) and the *Ramp Meter Design Manual* (Caltrans, January 2000) and have been used for other studies in Orange County. The capacities for calculating ramp V/C ratios are summarized in Table 1-5 together with the overall impact criteria for freeway ramps within the study area. LOS E has been established by Caltrans as the performance standard for freeway ramps.

Table 1-4

ARTERIAL INTERSECTION PERFORMANCE CRITERIA

V/C Calculation Methodology

Level of service to be based on peak hour intersection capacity utilization (ICU) values calculated using the following assumptions:

Saturation Flow Rate: 1,600 vehicles/hour/lane for City of San Clemente intersections, 1,700 vehicles/hour/lane for all other jurisdictions in the study area.

Clearance Interval: .00 for City of San Clemente intersections, .05 for all other jurisdictions in the study area.

Performance Standards

Level of Service D (peak hour ICU less than or equal to 0.90) for locations other than CMP intersections and Crown Valley Parkway intersections between I-5 and Marguerite Parkway.

Level of Service E (peak hour ICU less than or equal to 1.00) for CMP intersections (i.e., the I-5 ramp intersections at Crown Valley Parkway and at Ortega Highway, and the intersection of Moulton Parkway and Crown Valley Parkway) and Crown Valley Parkway intersections between I-5 and Marguerite Parkway.

Impact Thresholds

An intersection is considered to be adversely impacted if:

1. The intersection is forecast to operate deficiently (i.e., worse than the performance standard).

2. Compared to the ICU in the no-project alternative, the ICU in the with project alternative increases as follows:

   - 0.01 or greater at County of Orange, City of Mission Viejo, City of Rancho Santa Margarita and City of San Juan Capistrano intersections (the impact threshold specified in the GMP and adopted by the Cities of Mission Viejo, Rancho Santa Margarita and San Juan Capistrano).

   - Greater than 0.01 at City of Laguna Hills, City of Laguna Niguel and City of San Clemente intersections (the impact threshold adopted by those Cities).

   - Greater than 0.03 at CMP intersections (the impact threshold specified in the CMP).

Abbreviations: V/C – Volume/Capacity Ratio
CMP – Orange County Congestion Management Program
GMP – Orange County Growth Management Plan

Table 1-5

FREEWAY RAMP PERFORMANCE CRITERIA

V/C Calculation Methodology

Level of service to be based on peak hour volume/capacity (V/C) ratios calculated using the following ramp capacities:

Metered On-Ramps

A maximum capacity of 900 vehicles per hour (vph) for a one-lane metered on-ramp with only one mixed-flow lane at the meter.

A maximum capacity of 1,080 (20 percent greater than 900) vph for a one-lane metered on-ramp with one mixed-flow lane at the meter plus one HOV preferential lane at the meter.

A maximum capacity of 1,500 vph for a one-lane metered on-ramp with two mixed-flow lanes at the meter.

A maximum capacity of 1,800 vph for a two-lane metered on-ramp with two mixed-flow lanes at the meter.

Non-Metered On-Ramps and Off-Ramps

A maximum capacity of 1,500 vph for a one-lane ramp.

A maximum capacity of 2,250 (50 percent greater than 1,500) vph for a two-lane on-ramp that tapers to one merge lane at or beyond the freeway mainline gore point and for a two-lane off-ramp with only one auxiliary lane.

A maximum capacity of 3,000 vph for a two-lane on-ramp that does not taper to one merge lane and for a two-lane off-ramp with two auxiliary lanes.

Performance Standard

Level of Service E (peak hour V/C less than or equal to 1.00).

(Continued)

Table 1-5 (cont)
FREEWAY RAMP PERFORMANCE CRITERIA

Impact Thresholds

A freeway ramp is considered to be adversely impacted if:

1. The ramp is forecast to operate deficiently with the project (i.e., worse than the performance standard).

2. Compared to the V/C in the no-project alternative, the V/C in a with-project alternative increases as follows:

   - 0.01 or greater for ramps at County of Orange, City of Mission Viejo, City of Rancho Santa Margarita and City of San Juan Capistrano intersections (the impact threshold specified in the GMP and adopted by the Cities of Mission Viejo, Rancho Santa Margarita and San Juan Capistrano).

   - Greater than 0.01 for ramps at City of Laguna Hills, City of Laguna Niguel and City of San Clemente intersections (the impact threshold adopted by those Cities).

Abbreviations: GMP – Orange County Growth Management Plan

DEFINITIONS

Certain terms used throughout this report are defined below to clarify their intended meaning:

ADT	Average Daily Traffic. Generally used to measure the total two-directional traffic volumes passing a given point on a roadway.
CMP	Congestion Management Program administered by the Orange County Transportation Authority.
DU	Dwelling Unit. Used in quantifying residential land use.
FSP	Fair Share Participation, as applied to funding of the future transportation improvements.
GMP	Growth Management Plan included as a component of the General Plans of the Cities and the County of Orange.
ICU	Intersection Capacity Utilization. A measure of the volume to capacity ratio for an intersection. Typically used to determine the peak hour level of service for a given set of intersection volumes.
LOS	Level of Service. A scale used to evaluate circulation system performance based on intersection ICU values or volume/capacity ratios of arterial segments.
Peak Hour	This refers to the hour during the AM peak period (typically 7 AM - 9 AM) or the PM peak period (typically 3 PM - 6 PM) in which the greatest number of vehicle trips are generated by a given land use or are traveling on a given roadway.
Tripend	A trip generation measure which represents the total trips entering and leaving a location.
TSF	Thousand Square Feet. Used in quantifying non-residential land uses, and refers to building floor area.
V/C	Volume to Capacity Ratio. This is typically used to describe the percentage of capacity utilized by existing or projected traffic on a segment of an arterial or intersection.
VPD	Vehicles Per Day. Similar to ADT, but more typically applied to trip generation (i.e., the amount of traffic generated by a given amount of land use).
VPH	Vehicles Per Hour. Used for roadway volumes (counts or forecasts) and trip generation estimates. Measures the number of vehicles in a one hour period, typically the AM or PM peak hour.

Chapter 2.0
TRANSPORTATION SETTING

This chapter describes the transportation setting for the proposed project. It is intended to provide information on existing and future traffic conditions in the study area.

EXISTING CIRCULATION SYSTEM

The existing highway network in the study area is illustrated in Figure 2-1. For arterial roads in the study area, the number of existing mid-block travel lanes are noted together with the classification of each road (e.g., major arterial, primary arterial, secondary arterial, etc.) as currently designated in the Orange County Master Plan of Arterial Highways (MPAH). For the freeway and tollway facilities in the study area, the number of existing general purpose, high occupancy vehicle (HOV) and auxiliary lanes for each freeway/tollway segment are noted.

Figure 2-2 shows the existing average daily traffic (ADT) volumes on the study area circulation system. Existing ADT volumes on arterial roadways in the study area are based on weekday 24-hour traffic count data collected in 2003. Freeway counts on I-5 are taken from 2002 Caltrans annual average daily traffic counts that have been converted to weekday ADT based on conversion factors provided by Caltrans. Existing ADT volumes shown on the SR-73 and SR-241 tollways are taken from 2002 count data supplied by the Transportation Corridor Agencies (TCA). As noted in the performance criteria discussion in the previous chapter, ADT volumes are not used in the traffic impact analysis, but are presented here to provide a reference point for the traffic forecasts and for other sections of the Environmental Impact Report (EIR) such as air quality and noise.

EXISTING TRAFFIC CONDITIONS

Existing conditions are described here using the performance criteria from Chapter 1.0. The information represents an existing baseline for the study area circulation system.

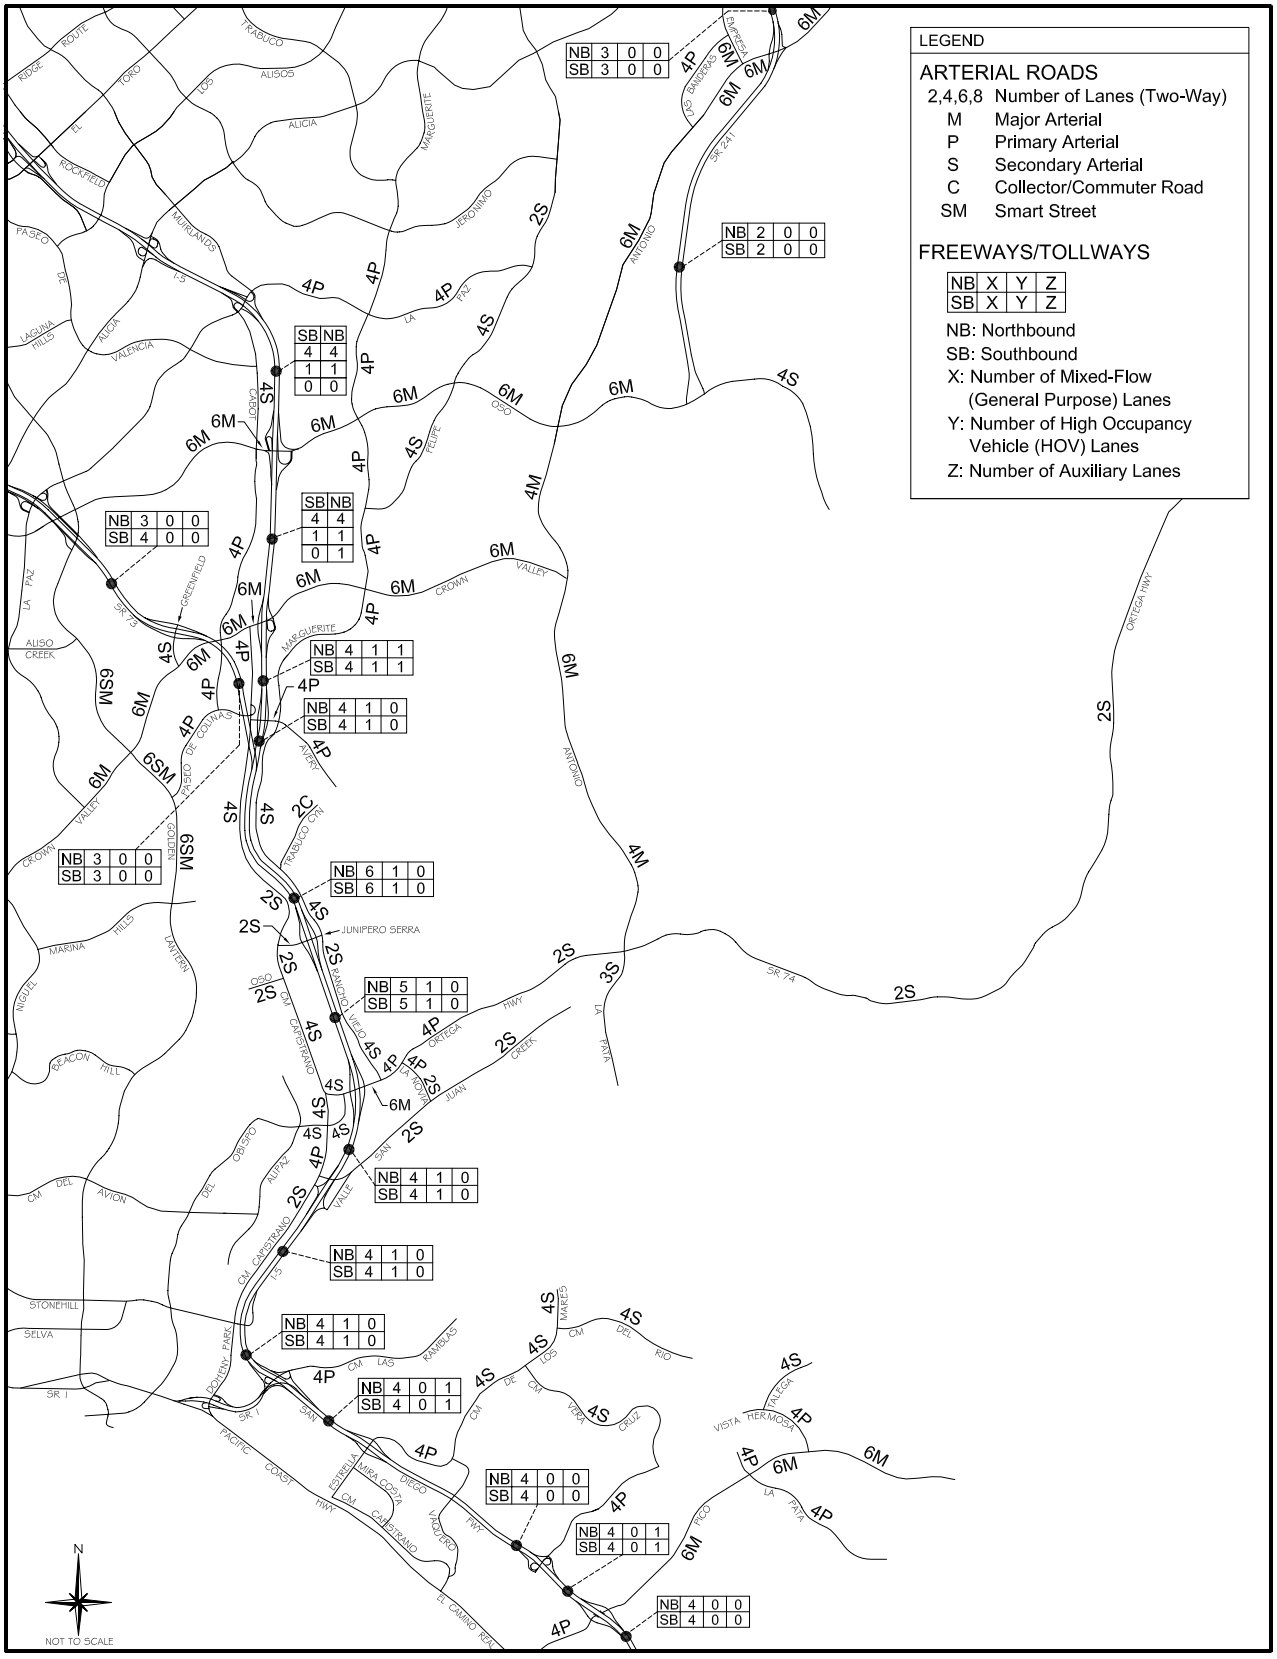

Figure 2-1

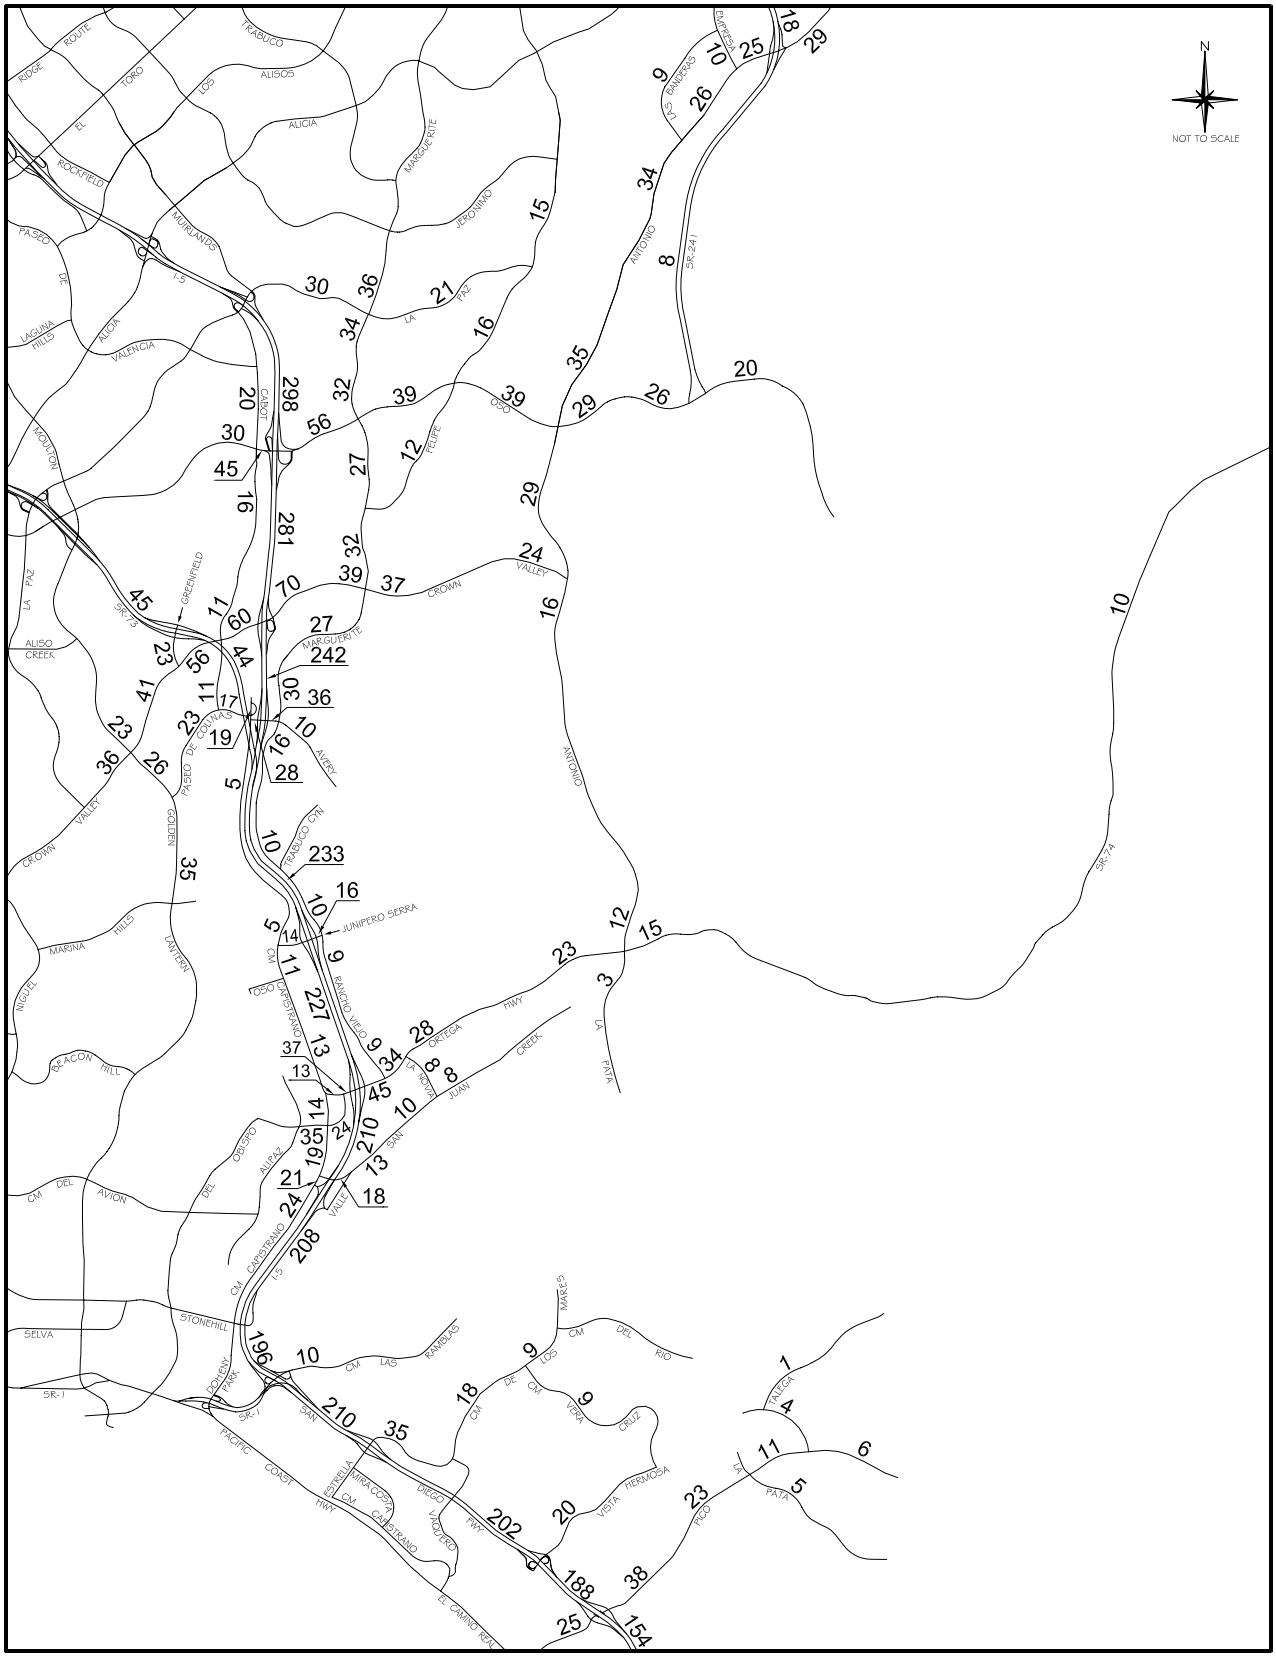
EXISTING CIRCULATION SYSTEM
(MAY 2003)



Note: Arterial counts were taken in 2003, I-5 counts are 2002 Caltrans annual average daily traffic counts converted to weekday average daily traffic (ADT), and SR-73 and SR-241 counts are 2002 Transportation Corridor Agencies counts.

Figure 2-2

EXISTING ADT VOLUMES (000s)

Intersections and Freeway Ramps

Table 2-1 lists the existing intersection capacity utilization (ICU) values for the study area intersections and Table 2-2 summarizes existing peak hour freeway ramp volumes and volume/capacity (V/C) ratios. The peak hour intersection volumes and peak hour ramp volumes are from traffic count data collected in 2003. Under existing conditions, four intersections do not meet the performance standard, and three ramps show deficiencies.

Freeways

As noted in the freeway mainline performance criteria discussion in Chapter 1.0, when the peak hour V/C ratio on a freeway mainline segment nears 1.0, unstable conditions can occur which may result in a breakdown in flow. This breakdown in flow causes a reduction in capacity (vehicle speeds drop below the speed at which maximum capacity is available), and hence the V/C increases, causing a further reduction in speed. The result is stop-and-go conditions. At the same time, the reduction in capacity and increase in V/C causes queue build-up and the stop-and-go conditions can extend for a considerable distance upstream of the problem section. Furthermore, this occurrence, and its severity (i.e., length of queue), can vary from day to day even when day to day fluctuations in traffic volumes are relatively small.

Speed and travel time measurements taken by Caltrans for the freeway system give a measure of when and where such conditions occur (i.e., for the day or days on which such measurements are taken). Specific level of service (LOS) values are assigned based on the measured speeds, the LOS being derived by comparing the measured speed with a minimum desirable operating speed (typically 35 mph). The travel time studies also reveal deficient freeway sections that are not in themselves a capacity problem, but which are adversely affected by queue build-up from a deficient section downstream. Hence, LOS values as determined from speed measurements may not equate to the V/C since a queue can extend back from a deficient section to a section with a relatively low V/C.

For these reasons, the V/C LOS is not always a true indication of the actual operating LOS on a freeway segment, particularly when a high V/C ratio on a given section adversely affects upstream sections because of queue build-up. The upstream section may have a relatively low V/C and thereby

(a) LOS E is acceptable at this location (Congestion Management Program (CMP) intersections and Crown Valley Parkway intersections between I-5 and Marguerite Parkway). LOS D is the adopted performance standard for all other intersection locations that are analyzed.

(b) This location operates deficiently in the AM and/or PM peak hour (i.e., the LOS is worse than the adopted LOS performance standard).

Abbreviations: LOS – level of service
V/C – volume/capacity ratio
NB – northbound
SB – southbound

(a) This ramp operates deficiently in the AM and/or PM peak hour (i.e., the LOS is worse than the LOS E performance standard adopted by Caltrans for I-5 ramps).

imply satisfactory operating conditions, but stop-and-go conditions extending back to this section would cause it to actually be operating under congested conditions.

Table 2-3 summarizes existing conditions (2002) for freeway mainline segments in the study area. It shows the LOS derived from the V/C ratio as given in the performance criteria together with operating LOS as determined from Caltrans field measurements.

Note that future traffic volumes as presented in this report represent "demand" and no attempt is made to estimate operating conditions such as discussed here (i.e., only the V/C LOS is reported).

FUTURE ROADWAY SYSTEM

A number of transportation planning programs currently in place provide direction for planning, developing, operating and maintaining the highway circulation system in southern California. At the regional level, the Regional Transportation Plan (RTP) provides a long-range circulation plan for the regional circulation system. The RTP focuses on regional transportation improvements such as freeway widening, HOV system enhancements, and freeway interchange improvements. The long-range circulation plan for the arterial system within Orange County is defined by the MPAH. This represents the arterial highway system in the Circulation Element of the County General Plan and the arterial street components are included in the General Plan Circulation Elements of the local jurisdictions in Orange County. The MPAH also identifies the existing and proposed freeway and toll road components of the circulation system. The long-range analysis uses two levels of future circulation system improvements. The first assumes implementation of only those MPAH and RTP improvements that are currently funded and/or committed, and the second assumes additional improvements with buildout of the MPAH and RTP.

The committed improvements include those that are in a capital improvement program of a local jurisdiction within the study area, or projects that are currently funded by Caltrans. Also included are improvements that have reasonable assurance of being built prior to the year 2025 by a specific funding source, such as the City of San Juan Capistrano's Reimbursement Agreement and Nexus Fee Program and the City of San Clemente's Regional Circulation Financing and Phasing Program (RCFPP). In addition, improvements that are part of conditions of approval for development that is included in the long-range demographic data forecasts (i.e., OCP-2000 projections) are also assumed to be committed.

Abbreviations: A – auxiliary lane
H – high occupancy vehicle (HOV) lane
LOS – level of service
V/C – volume/capacity ratio

* Parenthesized LOS values are from speed and travel time surveys carried out by Caltrans. The measured speeds in each section reflect queue build-up from a downstream deficient section and/or other prevailing conditions at the time the surveys were conducted. The prefix values for LOS "F" $^{(0,1,2,3)}$ represent different lengths of time during which congested conditions occur in the peak period.

Figure 2-3 illustrates the committed highway network in the study area. A list of the improvements contained in the committed network together with the source of funding or source of commitment according to the definition noted above can be found in Table 2-4. The major roadway improvements that are committed include widening of Crown Valley Parkway to eight lanes and selected intersection improvements. A summary of existing intersection lane configurations and committed intersection improvements is provided in Appendix C.

Figure 2-4 illustrates the circulation system in the study area based on full buildout of the General Plan Circulation Elements for the Cities within the study area as well as the Orange County MPAH. Table 2-5 lists the non-committed improvements associated with buildout of the study area circulation system, and a summary of non-committed intersection improvements is provided in Appendix C.

BACKGROUND ASSUMPTIONS

The following sections discuss other assumptions that are pertinent to the traffic analysis such as land use and associated traffic demand, and future traffic growth at the Orange County/San Diego County border.

Orange County Land Use and Traffic Demand

The adopted land use and development growth projections for Orange County are the Orange County Projections 2000 (OCP-2000) which cover five year intervals from 2000 to 2025. The OCP-2000 year 2025 projections provide the primary set of demographic data that is applied in the traffic analysis with the exception of the Cities of Mission Viejo, San Juan Capistrano, Laguna Niguel, and San Clemente and the unincorporated community of Ladera Ranch where General Plan land use data is applied. Those buildout land uses are consistent with OCP-2000 (i.e., they are minimally different).

Table 2-6 summarizes the growth in residential dwelling units (DUs), employment and ADT projections for the traffic analysis study area and for Orange County as a whole. By year 2025, south Orange County is projected to experience a 33 percent increase in housing, a 57 percent increase in employment, and a 40 percent increase in ADT demand, compared with countywide increases of 14 percent, 36 percent, and 20 percent in housing, employment, and ADT, respectively. Figure 2-5 shows the housing, employment and ADT growth for cities and communities in the traffic analysis study area.

Figure 2-5

LONG-RANGE STUDY AREA DEMOGRAPHIC DATA AND ADT TRIP GENERATION

I-5 Traffic Demand at the Orange County/San Diego County Border

The amount of future traffic on I-5 at the Orange County/San Diego County border has been the subject of considerable study over the years. The OCTA developed the most recent traffic forecasts on I-5 at the county border in coordination with the San Diego Association of Governments (SANDAG), the Southern California Association of Governments (SCAG) and Caltrans. A volume of 201,000 vehicles per weekday is forecast on I-5 at the Orange County/San Diego County border in year 2025 compared to an existing (2002) traffic count of 137,000 vehicles per weekday.

Using travel pattern data from the Orange County Transportation Analysis Model (OCTAM), it is found that approximately 58 percent of the existing and future I-5 traffic at the county border is projected to travel to and from Orange County and approximately 16 percent (around one quarter of the 58 percent) is destined to the traffic analysis study area (i.e., southern Orange County). The remaining 42 percent of I-5 traffic at the county border is projected to travel beyond Orange County (i.e., to and from the Counties of Los Angeles, Riverside, San Bernardino and Ventura).

Chapter 3.0
PROJECT DESCRIPTION

This chapter describes the traffic characteristics of the proposed project. Land use and trip generation for the project is summarized, and the distribution of project trips on the study area circulation system is presented. Land use and trip generation comparisons for project alternatives are provided in Chapter 7.0.

PROJECT OVERVIEW

A diagram of the development areas in the project can be seen in Figure 3-1 together with statistical summarizes of the development in each planning area. The overall project land uses can be summarized as follows:

Land Use	Amount
Single Family Detached Residential	4,212 Dwelling units
Single Family Attached and Apartments	3,788 Dwelling units
Age Restricted Residential (Senior Housing)	6,000 Dwelling units
Retail	980 Thousand square feet of floor area
Business Park/Office	4,220 Thousand square feet of floor area
Resort Hotel	250 Rooms

Also included are golf courses and schools. The project has an on-site circulation system which will provide accessibility for the development areas. This is illustrated in Figure 3-2 and involves a number of proposed changes to the existing Orange County Master Plan of Arterial Highways (MPAH). New Ortega Highway will provide a new east-west roadway north of San Juan Creek extending from Antonio Parkway to an intersection with existing Ortega Highway in the easternmost part of the project area. The north-south roadway labeled "C" Street will extend from the Gobernadora area south across Ortega Highway down into the Cristianitos Planning Area, and connect to the easterly termination point of Avenida Pico.

Another north-south roadway labeled "A" Street will extend from New Ortega Highway up through Chiquita Canyon to an intersection with existing Oso Parkway (this roadway would not serve through traffic). If SR-241 is extended southward, "C" Street will have an interchange with SR-241, replacing the interchange planned for Crown Valley Parkway (under the proposed arterial highway plan,

PROPOSED ROADWAY SYSTEM

the Crown Valley Parkway extension would not be built). Without the southward SR-241 extension, an arterial highway (labeled "F" Street) would be built along the SR-241 alignment and would terminate at Ortega Highway.

TRIP GENERATION

Traffic generation is expressed in vehicle tripends, defined as one-way vehicular movements, either entering or exiting the generating land use. Generation factors used in the traffic analysis are from the South County Sub-Area Model (SCSAM) referred to in Chapter 1.0 and described in the traffic model documentation (Reference 4 in Chapter 1.0). These in turn are consistent with generation factors used in the Orange County Transportation Analysis Model (OCTAM).

Table 3-1 summarizes the trip generation for the proposed project. Shown here are the peak hour and daily vehicle trip generation by land use type. The total project trip generation is 183,338 trips per day, of which 14,289 are in the AM peak hour and 18,033 are in the PM peak hour.

Table 3-2 summarizes the internal/external relationships by land use category. While a large proportion of work related trips are external to the project, trips for other purposes such as schools and shopping are internal. The overall result is that on an ADT basis, 44 percent of the tripends (28 percent of the trips) are internal. The internal proportions are slightly lower for the peak hour trips.

PROJECT TRIP DISTRIBUTION

The external trip distribution pattern for the project is presented in Figure 3-3. This is derived from the SCSAM and reflects the site's proximity to surrounding land use patterns and the mix of uses within the project. The distribution percentages are shown separately for the committed network only and for the committed network with the addition of a La Pata Avenue extension and the SR-241 extension.

PROJECT ALTERNATIVES

A number of project alternatives are evaluated here, the evaluation involving a full study area traffic analysis in some cases, and only a trip generation comparison in others. The purpose is to show

Project Roadway

Figure 3-3

PROJECT TRIP DISTRIBUTION

cumulative impact comparisons for those alternatives that differ substantially from the proposed project and from each other. The project alternatives are discussed in detail in Chapter 7.0.

Chapter 4.0
IMPACT ANALYSIS

This chapter analyzes the impacts of the proposed project on the roadway system in the study area. It includes both an existing plus project analysis, and then a cumulative analysis, consistent with CEQA requirements for evaluating land use project impacts.

EXISTING PLUS PROJECT IMPACTS

The impacts of project traffic volumes were evaluated based on peak hour operating conditions at the study area intersections, freeway ramps and freeway mainline segments. Project trips were added to the existing background volumes presented in Chapter 3.0, and the impacts of the project were then identified by comparing conditions at each location for the without and with-project traffic volumes.

For this analysis the existing circulation system (May 2003) is the baseline used in identifying project impacts. Figure 4-1 shows the existing plus project ADT volumes and these can be compared with the existing (no-project) volumes presented in Chapter 2.0. The with-project volumes were derived from the South County Sub-Area Model (SCSAM) by incorporating the project land uses into the existing land use database, carrying out a trip distribution, and then assigning resulting trips to the study area circulation system. Hence, the results reflect the addition of project trips to existing land uses in the study area and the redistribution effects that occur when additional land uses are introduced into the traffic model process. The results are discussed in the following sub-sections.

Intersections

Table 4-1 summarizes the peak hour intersection capacity utilization (ICU) results for the study area intersections (an intersection location map can be seen in Figure 4-2 and actual ICU calculations are included in Appendix C). The table lists existing (no-project) traffic conditions (ICUs and levels of service) followed by the corresponding existing plus project ICUs and levels of service. Also noted in the table are locations where the project has a significant impact based on the significance criteria. The project results in significant impacts at the following eight locations under existing plus project conditions:

Abbreviations: ICU - intersection capacity utilization LOS - level of service

(a) LOS E is acceptable at this location (Congestion Management Program (CMP) intersections and Crown Valley Parkway intersections between I-5 and Marguerite Parkway). LOS D is the adopted performance standard for all other intersection locations that are analyzed.
(b) This location is forecast to operate deficiently in the AM and/or PM peak hour (i.e., the LOS is worse than the adopted LOS performance standard).

Shaded entries denote impacts compared to no-project conditions. An intersection location is considered to be impacted when it is forecast to operate at an unacceptable LOS and, compared to no-project conditions, the ICU increases as follows:
0.01 or greater for intersections in the Cities of Mission Viejo, Rancho Santa Margarita and San Juan Capistrano and in unincorporated County of Orange.
Greater than 0.01 for intersections in the Cities of Laguna Hills, Laguna Niguel and San Clemente.

Freeway Ramps

The impacts of project traffic volumes at freeway ramps in the study area were evaluated using the freeway ramp performance criteria defined in Chapter 1.0. Table 4-2 summarizes the peak hour volume-to-capacity (V/C) results for those locations. Project impacts occur at the following three ramp locations under existing plus project conditions:

I-5 southbound off-ramp at Oso
I-5 southbound off-ramp at Crown Valley
I-5 northbound on-ramp at Ortega

Freeway Segments

The freeway mainline V/C ratios for existing conditions with and without the project are summarized in Table 4-3. No freeway mainline impacts occur under existing plus project conditions based on the performance criteria applied here.

CUMULATIVE ANALYSIS

The cumulative analysis results presented here represent existing plus project plus cumulative conditions. They thereby evaluate the project plus other growth in the study area in a cumulative setting. The traffic forecasts use 2025 demographic data as the basis for the cumulative setting. As noted in Chapter 2.0, the primary information source is the OCP-2000 demographic data forecasts for Orange County adopted by the Board of Supervisors in year 2000. These projections are the basis for long-range transportation planning in Orange County, and hence provide an appropriate cumulative database for long-range analysis purposes. Other sources include the General Plans of Cities in the study area and a

Abbreviations: LOS – level of service
V/C – volume/capacity ratio
NB – northbound
SB – southbound

(a) This ramp is forecast to operate deficiently in the AM and/or PM peak hour (i.e., the LOS is worse than the LOS E performance standard adopted by Caltrans for I-5 ramps).

Shaded entries denote impacts compared to no-project conditions. A ramp location is considered to be impacted when it is forecast to operate at LOS F and, compared to no-project conditions, the V/C ratio increases as follows:
0.01 or greater for ramps at intersections in the Cities of Mission Viejo and San Juan Capistrano.
Greater than 0.01 for ramps at intersections in the Cities of Laguna Niguel and San Clemente.

Abbreviations:
A – auxiliary lane
CAP – capacity
H – high occupancy vehicle (HOV) lane
LOS – level of service
V/C – volume/capacity ratio

(a) This segment of I-5 is forecast to operate deficiently in the AM and/or PM peak hour in one or both directions (i.e., the LOS is worse than the LOS E performance standard adopted by Caltrans for the I-5 mainline.

No freeway mainline impacts occur under this scenario. An I-5 mainline location is considered to be impacted when it is forecast to operate at LOS F and, compared to no-project conditions, the V/C ratio increases by more than 0.03 (the impact threshold specified in the Orange County Congestion Management Program).

detailed discussion on how data from individual sources is incorporated into the SCSAM can be found in the traffic model description documentation (Reference 3 in Chapter 1.0.)

Analysis Scenarios

The cumulative analysis addresses three scenarios, each with different transportation system assumptions for the portion of the study area outside the project area:

1. Committed circulation system.
2. Committed circulation system plus La Pata Avenue extension.
3. Committed circulation system plus La Pata Avenue extension and the Foothill Transportation Corridor South (FTC-S).

Each scenario includes the proposed project (including the proposed MPAH amendments) and year 2025 cumulative land use assumptions for the remainder of the study area. The committed circulation system in Scenario 1 was described in Chapter 2.0, and scenarios 2 and 3 add to that with the La Pata Avenue extension and the FTC-S (i.e., the southerly extension of SR-241).

The 2025 with-project ADT volumes under the three circulation system scenarios are shown in Figures 4-3 through 4-5. Table 4-4 lists the corresponding 2025 peak hour ICU values for the study area intersections. Intersection location maps for 2025 cumulative conditions without and with the FTC-S are provided in Figures 4-6 and 4-7, respectively, and actual ICU calculations are included in Appendix C. Locations that do not meet the performance criteria are so noted and are considered cumulative impacts of the project.

Table 4-5 summarizes the 2025 peak hour V/C results for the study area freeway ramps. The table lists the 2025 V/C values for the AM and PM peak hours respectively for each of the three analysis scenarios. Locations that are identified as cumulative impacts of the project are so noted.

Year 2025 freeway mainline data for each of the three scenarios can be found in Tables 4-6 through 4-8. The volumes shown here represent future demand under each scenario and the levels of service are based on corresponding V/C ratios. As discussed in Chapter 2.0, under existing freeway conditions, flow breakdown can occur as the V/C reaches 1.0 and the resulting stop-and-go conditions can queue into upstream segments. Under such circumstances, actual operating LOS will typically be worse

Abbreviations: ICU - intersection capacity utilization LOS - level of service

(a) LOS E is acceptable at this location (Congestion Management Program (CMP) intersections and Crown Valley Parkway intersections between I-5 and Marguerite Parkway). LOS D is the adopted performance standard for all other intersection locations that are analyzed.

(b) This location is forecast to operate deficiently in the AM and/or PM peak hour (i.e., the LOS is worse than the adopted LOS performance standard).

Shaded entries denote cumulative project impacts.

than the V/C derived LOS. As can be seen, a number of locations show 2025 deficiencies and thereby represent a cumulative impact of the project.

A summary of the 2025 deficiencies under each of the three scenarios can be seen in Figures 4-8 through 4-10. These represent the locations at which cumulative impacts are identified and for which transportation improvements are identified in the next chapter. Table 4-9 provides a listing of the deficiencies for each scenario in tabular form. The shaded squares in the table denote the deficiencies in each scenario.

Chapter 5.0
TRANSPORTATION IMPROVEMENTS

This chapter discusses the study area transportation improvements that would be required to mitigate the cumulative impacts identified in Chapter 4.0.

PROPOSED LONG-RANGE IMPROVEMENTS

A comprehensive transportation improvement program is presented here to mitigate the cumulative impacts identified in the previous chapter. These improvements address traffic demands for the year 2025 based on the cumulative land use assumptions discussed earlier in this report. The project share of future trips at each location is then identified. Such shares form the basis for a project mitigation program which defines the responsibility of the project with respect to the identified improvements.

Table 5-1 summarizes the proposed improvement program, Figures 5-1 and 5-2 illustrate the proposed improvements to the committed circulation system under conditions without and with the FTC-S, respectively, and 2025 with-project ADT volumes with the proposed improvement program are illustrated in Figures 5-3 and 5-4 for conditions without and with the FTC-S, respectively. As the summary table and illustrations indicate, the La Pata Avenue extension is a component of the proposed improvement program. The analysis presented in the previous chapter showed that the addition of the La Pata Avenue extension to the 2025 cumulative with-project setting eliminates peak hour deficiencies forecast at the following ramp and intersection locations under cumulative conditions based on the committed circulation system without the La Pata Avenue extension:

Intersections
24. Marguerite & Avery (Mission Viejo)
33. La Novia & San Juan Creek (San Juan Capistrano)
38. Talega & Vista Hermosa (San Clemente)
53. Valle & La Novia/I-5 northbound ramps (San Juan Capistrano)

Ramps
I-5 southbound off-ramp at Vista Hermosa
I-5 northbound on-ramp at Pico

Table 5-1

2025 LONG-RANGE CIRCULATION SYSTEM IMPROVEMENT PROGRAM

Location	Jurisdiction	Improvements
FREEWAY INTERCHANGES		
Marguerite Pkwy-Saddleback College/I-5 Connectors	Caltrans	Construct new connector ramps to and from I-5 north.
Ortega Hwy/I-5 Interchange	Caltrans	Reconstruct interchange: design to be determined by Caltrans.
FREEWAY RAMPS		
I-5 southbound off-ramp at Oso Pkwy	Caltrans	Add second drop lane from I-5 to the off-ramp.
I-5 southbound off-ramp at Crown Valley Pkwy	Caltrans	Add second auxiliary lane from I-5 to the off-ramp.
ARTERIAL ROADS		
Antonio Pkwy (Old Ortega Hwy to New Ortega Hwy)	County	Roadway widening.
La Pata Ave extension	County	Extend as four-lane primary arterial from current terminus south of Ortega Hwy to existing termination point in San Clemente.
New Ortega Hwy (Antonio Pkwy to Old Ortega Hwy)	County	Construct four/six lane roadway.
Ortega Hwy (I-5 to Antonio Pkwy)	San Juan Capistrano /County	Traffic calming, roadway widening (east of existing four-lane section to Antonio Pkwy)
Oso Pkwy (east of Las Flores to SR-241)	County	Roadway widening.
Oso Pkwy (I-5 to Marguerite Pkwy)	Mission Viejo	Roadway widening.
INTERSECTIONS		
4. Felipe Rd & Oso Pkwy	Mission Viejo	Add second southbound left-turn lane.
5. Antonio Pkwy & Oso Pkwy	County	Add fourth southbound through lane, third northbound left-turn lane, and provide eastbound right-turn overlap with the northbound left-turn movement and northbound right-turn overlap with the westbound left-turn movement (needed under conditions with or without the FTC-S). Add fourth eastbound through lane (needed only under conditions without the FTC-S).
11. Marguerite Pkwy & Crown Valley Pkwy	Mission Viejo	Committed improvements (Ladera Ranch): add third and fourth eastbound through lanes and fourth westbound through lane, second northbound, southbound and westbound left-turn lanes, northbound right-turn lane, and convert southbound free right-turn lane to a standard right-turn lane. Proposed mitigation: convert second southbound through lane to shared second through/second right-turn lane and add a de-facto westbound right-turn lane.
12. Antonio Pkwy & Crown Valley Pkwy	County	Convert second eastbound through lane to a third left-turn lane, and add a third northbound left-turn lane and a second eastbound right-turn lane.
20. St of the Golden Lantern & Paseo de Colinas	Laguna Niguel	Committed improvements (City of Laguna Niguel): add third northbound and southbound through lanes. Proposed mitigation: no feasible mitigation has been identified at this time.

Table 5-1 (cont)
2025 LONG-RANGE CIRCULATION SYSTEM MITIGATION PROGRAM

Location	Jurisdiction	Improvements
INTERSECTIONS (cont)		
27. Rancho Viejo & Ortega	San Juan Capistrano	Add separate northbound right-turn lane and restripe northbound lanes to provide double left turn lanes and a dedicated through lane.
28. La Novia Ave & Ortega Hwy	San Juan Capistrano	Add second westbound left-turn lane (needed only under conditions without the FTC-S).
29. Antonio Pkwy-La Pata Ave & Ortega Hwy	County	Committed improvements (County of Orange): add second eastbound left-turn lane. Proposed mitigation: add second northbound through lane and southbound free right-turn lane (needed under conditions with or without the FTC-S). Proposed mitigation: add third northbound through lane, third southbound through lane, and second northbound left-turn lane (needed only under conditions without the FTC-S).
30. Cm Capistrano & Del Obispo St	San Juan Capistrano	Convert southbound right-turn lane to shared second through/right-turn lane, and add second westbound left-turn lane and second eastbound left-turn lane.
32. Valle Rd & San Juan Creek Rd	San Juan Capistrano	Add second westbound through lane.
37. Avd La Pata & Avd Vista Hermosa	San Clemente	Committed improvements (Talega): construct intersection and provide two northbound left-turn lanes, three northbound through lanes, one southbound left-turn lane, three southbound through lanes, one southbound right-turn lane, one westbound left-turn lane, two westbound through lanes, one eastbound left-turn lane, two eastbound through lanes, and one eastbound right-turn lane. Proposed Mitigation: add second and third eastbound left-turn lane, southbound free right-turn lane, and westbound right-turn lane (needed only under conditions without the FTC-S).
39. Cm Vera Cruz & Avd Vista Hermosa	San Clemente	Committed improvements (City of San Clemente): construct west leg of the intersection and provide a left-turn lane, two through lanes, and no right-turn lane on each leg of the intersection. Proposed mitigation: add second southbound left-turn lane and westbound right-turn lane.
43. Antonio Pkwy & New Ortega Hwy	County	Option 1 – Construct at-grade intersection and provide the following lanes: one northbound left-turn lane, three northbound through lanes, a northbound free right-turn lane, two southbound left-turn lanes, three southbound through lanes, a de-facto southbound right-turn lane, three westbound left-turn lanes, one westbound through lane, a westbound free right-turn lane, one eastbound left-turn lane, one eastbound through lane, and one eastbound right-turn lane. Option 2 – Construct grade separated intersection and provide the following lanes: uncontrolled (grade separated) westbound left-turn movement to southbound Antonio Parkway, one northbound left-turn lane, two northbound through lanes, a free northbound right-turn lane, two southbound left-turn lanes, three southbound through lanes, a de-facto southbound right-turn lane, one westbound through lane, a westbound free right-turn lane, one eastbound left-turn lane, and one eastbound through lane.

Table 5-1 (cont)
2025 LONG-RANGE CIRCULATION SYSTEM MITIGATION PROGRAM

Location	Jurisdiction	Improvements
INTERSECTIONS (cont)		
56. I-5 southbound ramps & Avd Pico	San Clemente	Convert second westbound through lane to shared second left-turn/through lane (needed only under conditions without the FTC-S).
59. SR-241 northbound ramps & Antonio Pkwy	Rancho Santa Margarita	Convert third westbound through lane to shared third through/second right-turn lane (needed under conditions with or without the FTC-S). Add second eastbound left-turn lane (needed only under conditions without the FTC-S).
74. I-5 northbound ramps & Junipero Serra Rd	San Juan Capistrano	Convert eastbound shared left-turn/through lane to a left-turn lane and add a second eastbound left-turn lane.

Because the La Pata Avenue extension, which is included in the proposed improvement program, addresses the cumulative deficiencies forecast at these locations, no additional improvements at these locations have been included in the proposed improvement program. Further discussion on the various components of the proposed improvement program follows.

Freeway Interchanges

The proposed project will add traffic to the Ortega Highway interchange. While long-range cumulative traffic is shown to have adequate levels of service under the committed improvements, short intersection spacing will affect the traffic operations at this location, and prevent the theoretical ICU values from being achieved. Additionally, traffic volumes on the northbound on-ramp exceed the performance threshold for both AM and PM peak hour under 2025 cumulative with-project conditions. Proposed mitigation for the I-5/Ortega Highway interchange involves reconstructing the interchange. A traffic study by the City of San Juan Capistrano and Caltrans is exploring the preferred design for this location, and a project study report (PSR) is scheduled for completion by mid-year 2004.

A similar situation occurs at the I-5/Avery Parkway and I-5/Crown Valley Parkway interchanges, whereby intersection spacing and other operational features prevent the theoretical ICUs from being achieved. To relieve the Avery Parkway and Crown Valley Parkway interchanges, the proposed mitigation involves the construction of new I-5 ramps to and from the north connecting to Marguerite Parkway at the entrance to Saddleback College. Inclusion of these ramps in the cumulative circulation system eliminates deficiencies that are otherwise forecast at the I-5 northbound direct on-ramp at Crown Valley Parkway and at the I-5 northbound on-ramp at Junipero Serra Road. Deficiencies remain at the I-5 southbound off-ramps at Oso Parkway and Crown Valley Parkway, therefore improvements to those two ramps are included in the proposed improvement program.

Arterials

Arterial improvements involve roadway widenings and the extension or construction of selected MPAH roadways. In the proposed improvement program, sections of Oso Parkway and Ortega Highway would be widened to their planned MPAH classification, and the La Pata Avenue extension would be built per its MPAH classification. The New Ortega Highway, a proposed MPAH roadway, would be

constructed as a four/six lane roadway. Not included in the mitigation program are several MPAH roadways which are either not currently planned for construction by the jurisdictions within which they are located or do not have identified funding sources at this time. These include the following:

Camino Los Padres (Laguna Niguel and San Juan Capistrano)
Camino Las Ramblas (San Juan Capistrano)
San Juan Creek Road (unincorporated County portion)
Alipaz Street northerly extension (San Juan Capistrano)

These may be the subject of future MPAH amendments or additions to a local improvement program by the jurisdiction(s) involved.

Intersections

Lane configuration improvements are included in the proposed improvement program for each intersection location that is forecast to operate deficiently under 2025 cumulative with-project conditions without and with the FTC-S. As noted earlier in Table 5-1, in some cases, all or part of the improvements proposed at a given intersection are only needed under cumulative conditions that do not include the FTC-S. It should be noted that because of existing right-of-way constraints at the Street of the Golden Lantern/Paseo de Colinas intersection in the City of Laguna Niguel, no improvements that would mitigate the cumulative deficiency at that intersection have been identified.

It should also be noted that the intersection list includes Rancho Viejo Road and Ortega Highway in San Juan Capistrano. While the 2025 cumulative ICU values do not indicate a deficiency at this location, operational considerations indicate that the theoretical ICU value is not achieved. Also, the MPAH buildout analysis discussed later in Chapter 8.0 indicates a potential deficiency at this intersection under MPAH buildout conditions with the proposed project and MPAH amendments. For these reasons, improvements to this intersection are included in the overall program.

The intersection of Antonio Parkway at New Ortega Highway is a new intersection that will be designed to have adequate capacity with and without the FTC-S. Future design studies aimed at ensuring that the intersection provides the needed capacity for long-range cumulative demand will consider both at-grade and grade separated plans at this location. Table 5-1 therefore lists a potential at-grade and a potential grade separated configuration for the intersection.

Table 5-2 summarizes the mitigation lane improvements and the 2025 cumulative lane configuration for each mitigated intersection. The information presented here allows a comparison between existing or committed lane configurations and those proposed as part of the improvement program.

TRAFFIC SHARES

Consistent with a cumulative impact analysis, project shares for each of the identified improvements were determined. These shares were calculated according to the following formula:

$$\text{Project share} = \frac{\text{Project traffic}}{\text{Total traffic minus traffic from existing land uses}}$$

Hence, only traffic from future land uses is included in the formula, and the project share of this "new" traffic calculated accordingly. The values are calculated using ADT volumes so that total usage of a facility by the project is fully tabulated. Note that for a new facility, traffic from existing land uses is assigned to that facility for the purpose of applying the formula.

Table 5-3 lists the project traffic shares for the identified improvements. Refer to Chapter 2.0 for a summary of the areas of growth that contribute to future traffic other than the proposed project.

LEVELS OF SERVICE AFTER MITIGATION

The proposed improvement program is intended to address year 2025 cumulative impacts. Table 5-4 lists the deficient intersection locations under 2025 cumulative with-project conditions and shows the LOS without and with the proposed improvements. Table 5-5 lists the deficient freeway ramps and the LOS without and with the proposed improvements. The proposed improvements result in acceptable levels of service at each improvement location with the exception of three intersections (Marguerite Parkway/Crown Valley Parkway in the City of Mission Viejo, Camino Capistrano/Del Obispo Street in the City of San Juan Capistrano, and the I-5 southbound ramp intersection at Avenida Pico in the City of San Clemente) under cumulative with-project conditions without the FTC-S, and one intersection (Street of the Golden Lantern/Paseo de Colinas in the City of Laguna Niguel) under cumulative with-project conditions with or without the FTC-S.

Abbreviations: LOS – level of service
V/C – volume/capacity ratio

The Street of the Golden Lantern/Paseo de Colinas intersection remains deficient after mitigation because, as mentioned earlier, no feasible mitigation improvements have been identified due to existing right-of-way constraints at that location. It should be noted that while the Ranch Plan share of future traffic at this intersection is three percent as indicated in Table 5-3, this represents less than one percent of the total (existing and future) traffic that is forecast at that intersection under long-range cumulative conditions.

As indicated in Table 5-5, the at-grade and grade separated plans at the Antonio Parkway/New Ortega Highway intersection both result in acceptable levels of service under cumulative conditions with the FTC-S. However, only the grade separated improvement plan results in acceptable levels of service under cumulative conditions without the FTC-S. For this reason, a grade separated plan may be the preferred design option.

The LOS summaries presented here do not include deficiencies identified for the I-5 mainline. Improvements to the I-5 mainline are part of regional transportation improvement programs with associated timing and funding sources.

Chapter 6.0
SHORT-RANGE ANALYSIS

This chapter discusses the short-range impacts of the project based on the amount of project development that is anticipated by 2010, and identifies the mitigation measures necessary to accommodate the traffic from that level of short-range project development. The analysis thereby addresses the requirements of the Growth Management Plan (GMP) and the Congestion Management Program (CMP).

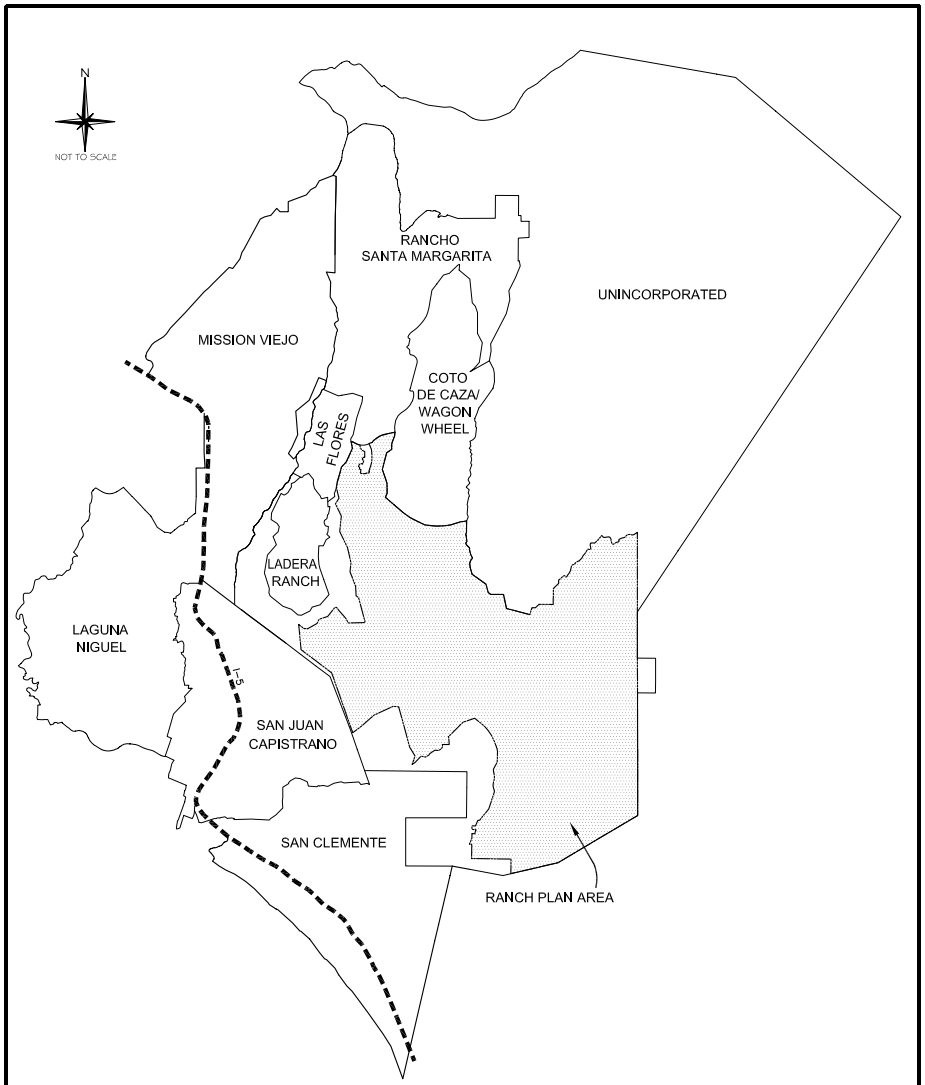
TRANSPORTATION SETTING

The year 2010 is used for this short-range project analysis. The 2010 no-project scenario assumes no development in the project area and the existing circulation system plus committed improvements. Year 2010 demographic data in the surrounding area is derived from OCP-2000 and is summarized in Figure 6-1 by cities and communities in the study area. For the area referenced here, the 2010 average daily traffic (ADT) growth represents around 61 percent of the ADT growth that is forecast between now and 2025.

The analysis results presented here were derived from the year 2010 version of the South County Sub-Area Model (SCSAM). No-project and with-project forecasts were prepared using the SCSAM and reflect the redistribution of trips associated with the introduction of the proposed project. Detailed results can be found in the appropriate appendices to this report and the main findings are summarized in this chapter.

SHORT-RANGE PROJECT DESCRIPTION

The short-range (2010) project comprises 5,000 residential dwelling units and a commercial/ business center (510,000 square feet). Figure 6-2 illustrates the short-range project development area and the proposed circulation system for the 2010 level of project development. In the short-range project, New Ortega Highway is assumed to extend eastward from Antonio Parkway, but does not connect to existing Ortega Highway.



City of Mission Viejo

Figure 6-2

SHORT-RANGE PROJECT DEVELOPMENT AREA

Table 6-1 summarizes the trip generation for the short-range (2010) project. Shown here are the peak hour and daily vehicle trip generation by land use. The short-range project trip generation is 50,864 trips per day, of which 3,965 are in the AM peak hour and 4,920 are in the PM peak hour.

SHORT-RANGE PROJECT IMPACTS

Year 2010 no-project and short-range project ADT volumes are illustrated in Figures 6-3 and 6-4, respectively. As shown, addition of short-range project traffic increases volumes primarily along Ortega Highway and Crown Valley Parkway and on Antonio Parkway south of Crown Valley Parkway. Small increases are seen along Oso Parkway and Antonio Parkway (north of Oso Parkway). The following discusses the impacts of the short-range project on the various components of the surrounding transportation system, and a proposed mitigation program that addresses the short-range impacts is outlined at the end of this chapter.

Intersections

Table 6-2 summarizes the year 2010 no-project and short-range project peak hour intersection capacity utilization (ICU) results for the study area intersections (a 2010 with-project intersection location map is provided in Figure 6-5, and actual ICU calculations are included in Appendix C). Of the 13 intersection locations that are forecast to operate deficiently under year 2010 no-project and short-range project conditions, the following 11 locations are impacted by the short-range project:

4. Felipe & Oso (Mission Viejo)
5. Antonio & Oso (County)
11. Marguerite & Crown Valley (Mission Viejo)
12. Antonio & Crown Valley (County)
27. Rancho Viejo & Ortega (San Juan Capistrano)
28. La Novia & Ortega (San Juan Capistrano)
29. Antonio/La Pata & Ortega (County)
30. Camino Capistrano & Del Obispo (San Juan Capistrano)
32. Valle & San Juan Creek (San Juan Capistrano)
33. La Novia & San Juan Creek (San Juan Capistrano)

Abbreviations: ICU - intersection capacity utilization LOS - level of service

(a) LOS E is acceptable at this location (Congestion Management Program (CMP) intersections and Crown Valley Parkway intersections between I-5 and Marguerite Parkway). LOS D is the adopted performance standard for all other intersection locations that are analyzed.
(b) This location is forecast to operate deficiently in the AM and/or PM peak hour (i.e., the LOS is worse than the adopted LOS performance standard).

Shaded entries denote impacts compared to no-project conditions. An intersection location is considered to be impacted when it is forecast to operate at an unacceptable LOS and, compared to no-project conditions, the ICU increases as follows:
0.01 or greater for intersections in the Cities of Mission Viejo, Rancho Santa Margarita and San Juan Capistrano and in unincorporated County of Orange.
Greater than 0.01 for intersections in the Cities of Laguna Hills, Laguna Niguel and San Clemente.

INTERSECTION LOCATION MAP
- 2010 SHORT-RANGE PROJECT

Freeway Ramps

Table 6-3 summarizes the year 2010 peak hour volume/capacity (V/C) results for the freeway ramps in the study area. Of the five ramp locations that are forecast to operate deficiently under 2010 no-project and short-range project conditions, the following three ramps are impacted by the short-range project:

I-5 southbound off-ramp at Oso
I-5 southbound off-ramp at Crown Valley
I-5 northbound on-ramp at Ortega

Freeway Segments

Year 2010 freeway mainline peak hour V/C ratios for no-project and short-range project conditions are summarized in Table 6-4. Five I-5 mainline segments are forecast to be deficient under year 2010 no-project and short-range project conditions. None of the deficient mainline segments are significantly impacted by the short-range project.

LA PATA AVENUE EXTENSION

A special analysis was conducted to examine the effect of the La Pata Avenue extension together with the short-range project under year 2010 conditions on the study area circulation system. The intent is to show the effect of this roadway extension and the extent to which it would mitigate any of the year 2010 short-range project impacts identified in the previous section.

Figure 6-6 illustrates the 2010 short-range project ADT volumes for this scenario. The extension of La Pata Avenue reduces traffic volumes on Ortega Highway and Crown Valley Parkway and increases traffic volumes on Antonio Parkway. The following table summarizes the ADT differences.

Abbreviations: LOS – level of service
V/C – volume/capacity ratio
NB – northbound
SB – southbound

(a) This ramp is forecast to operate deficiently in the AM and/or PM peak hour (i.e., the LOS is worse than the LOS E performance standard adopted by Caltrans for I-5 ramps).

Shaded entries denote impacts compared to no-project conditions. A ramp location is considered to be impacted when it is forecast to operate at LOS F and, compared to no-project conditions, the V/C ratio increases as follows:
0.01 or greater for ramps at intersections in the Cities of Mission Viejo and San Juan Capistrano.
Greater than 0.01 for ramps at intersections in the Cities of Laguna Niguel and San Clemente.

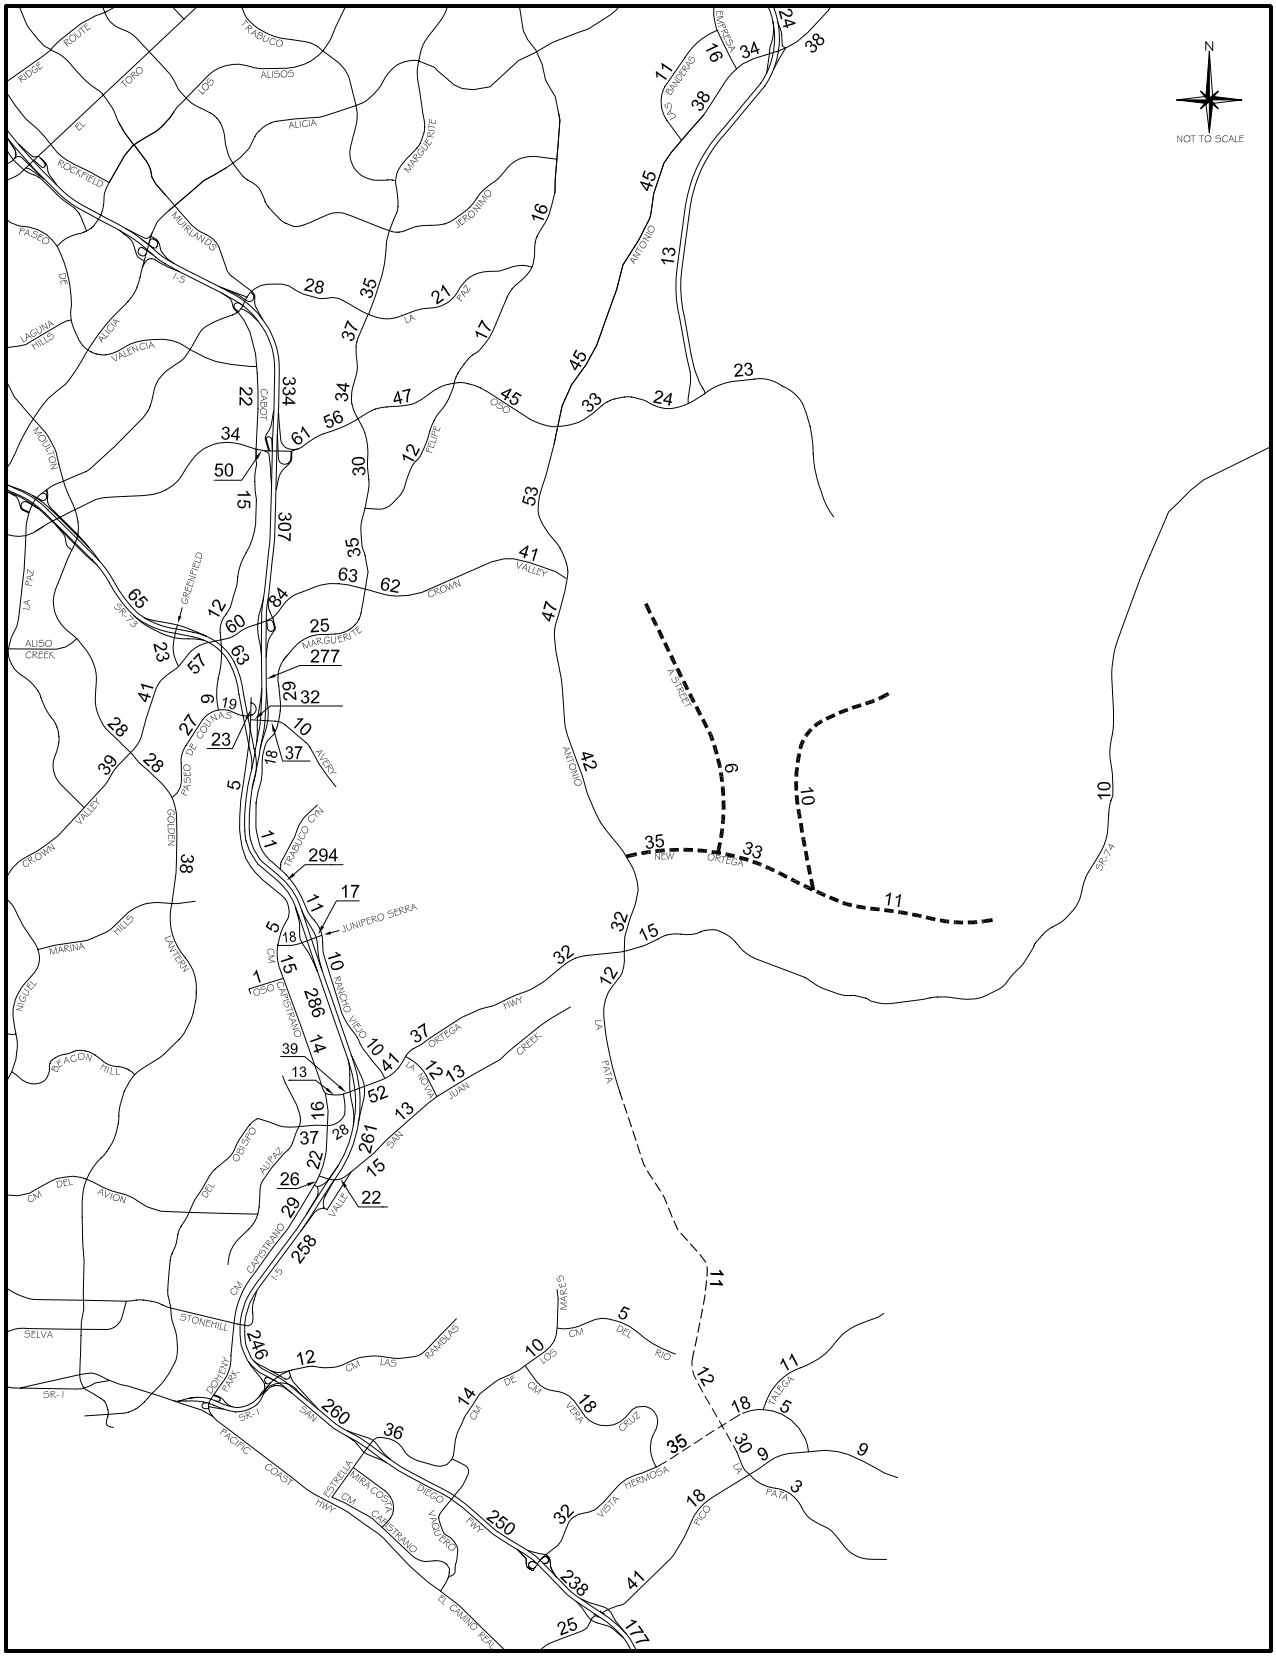
Abbreviations: A – auxiliary lane
CAP – capacity
H – high occupancy vehicle (HOV) lane
LOS – level of service
V/C – volume/capacity ratio

(a) This segment of I-5 is forecast to operate deficiently in the AM and/or PM peak hour in one or both directions (i.e., the LOS is worse than the LOS E performance standard adopted by Caltrans for the I-5 mainline.

No freeway mainline impacts occur under this scenario. An I-5 mainline location is considered to be impacted when it is forecast to operate at LOS F and, compared to no-project conditions, the V/C ratio increases by more than 0.03 (the impact threshold specified in the Orange County Congestion Management Program).



Legend

--------- Future Roadway
- - - - - - - - Project Roadway

Figure 6-6

2010 ADT VOLUMES (000s) - SHORT-RANGE PROJECT
(COMMITTED CIRCULATION SYSTEM WITH LA PATA)

Roadway	2010 Short-Range Project ADT Volumes (000s)		
	Without La Pata	With La Pata	Difference
Oso Parkway (east of I-5)	62	61	-1
Crown Valley Parkway (east of I-5)	86	84	-2
Ortega Highway (east of I-5)	56	52	-4
Ortega Highway (west of Antonio/La Pata)	36	32	-4
Antonio Parkway (north of Oso)	44	45	+1
Antonio Parkway (north of Ortega)	27	32	+5
Avenida Pico (north of I-5)	48	41	-7
Avenida Vista Hermosa (north of I-5)	34	32	-2

Table 6-5 summarizes the year 2010 peak hour ICU results for this alternative, and Table 6-6 summarizes the corresponding peak hour V/C data for the freeway ramps in the study area. The peak hour freeway mainline volumes and V/C ratios for this alternative are listed in Table 6-7. The effect of the La Pata Avenue extension is to mitigate the following year 2010 short-range intersection and ramp impacts:

Intersections
27. Rancho Viejo & Ortega (San Juan Capistrano)
28. La Novia & Ortega (San Juan Capistrano)
30. Camino Capistrano & Del Obispo (San Juan Capistrano)
32. Valle & San Juan Creek (San Juan Capistrano)
33. La Novia & San Juan Creek (San Juan Capistrano)

Ramps
I-5 southbound off-ramp at Oso

Because the extension of La Pata Avenue allows traffic to travel south to San Clemente and I-5 via the arterial extension, and because of other reorientations in traffic that occur with the extension, the following additional ramp and intersection locations are deficient under this scenario:

Intersections
37. La Pata & Vista Hermosa (San Clemente)
56. I-5 southbound ramps & Pico (San Clemente)

Ramps
I-5 southbound off-ramp at Ortega

Abbreviations: ICU - intersection capacity utilization NB - northbound
LOS - level of service SB - southbound

(a) LOS E is acceptable at this location (Congestion Management Program (CMP) intersections and Crown Valley Parkway intersections between I-5 and Marguerite Parkway). LOS D is the adopted performance standard for all other intersection locations that are analyzed.

(b) This location is forecast to operate deficiently in the AM and/or PM peak hour (i.e., the LOS is worse than the adopted LOS performance standard).

Shaded entries denote impacts compared to no-project conditions. An intersection location is considered impacted when it is forecast to operate at an unacceptable LOS and, compared to no-project conditions, the ICU increases as follows:
0.01 or greater for intersections in the Cities of Mission Viejo, Rancho Santa Margarita and San Juan Capistrano and in unincorporated County of Orange.
Greater than 0.01 for intersections in the Cities of Laguna Hills, Laguna Niguel and San Clemente.

Abbreviations: LOS – level of service
V/C – volume/capacity ratio

(a) This ramp is forecast to operate deficiently in the AM and/or PM peak hour (i.e., the LOS is worse than the LOS E performance standard adopted by Caltrans for I-5 freeway ramps).

Shaded entries denote impacts compared to no-project conditions. A ramp location is considered to be impacted when it is forecast to operate at LOS F and, compared to no-project conditions, the V/C ratio increases as follows:
0.01 or greater for ramps at intersections in the Cities of Mission Viejo and San Juan Capistrano.
Greater than 0.01 for ramps at intersections in the Cities of Laguna Niguel and San Clemente.

	SB	4	8,000	6,220	.78	D	8,000	8,450	1.06	F

Abbreviations: LOS – level of service
V/C – volume/capacity ratio

(a) This segment of I-5 is forecast to operate deficiently in the AM and/or PM peak hour in one or both directions (i.e., the LOS is worse than the LOS E performance standard adopted by Caltrans for the I-5 mainline).

LA PATA AVENUE EXTENSION AND ARTERIAL SOUTH OF OSO PARKWAY

An additional special analysis was conducted to evaluate the effect of the La Pata Avenue extension together with a new arterial south of Oso Parkway that would follow the FTC-S alignment and extend south to New Ortega Highway. Figure 6-7 illustrates the 2010 short-range project ADT volumes for this scenario.

The effect of this circulation system alternative reduces traffic along Ortega Highway and Crown Valley Parkway, and causes a slight increase in traffic along Oso Parkway. The chart below summarizes the ADT volumes and differences compared to the volumes under the committed network:

	2010 Short-Range Project ADT Volumes (000s)		
Roadway	**Without La Pata**	**With La Pata**	**With La Pata & Arterial s/o Oso**
Oso Parkway (east of I-5)	62	61 (-1)	63 (+1)
Crown Valley Parkway (east of I-5)	86	84 (-2)	83 (-3)
Ortega Highway (east of I-5)	56	52 (-4)	50 (-6)
Ortega Highway (west of Antonio/La Pata)	36	32 (-4)	30 (-6)
Antonio Parkway (north of Oso)	44	45 (+1)	44 (0)
Antonio Parkway (north of Ortega)	27	32 (+5)	30 (+3)
Avenida Pico (north of I-5)	48	41 (-7)	41 (-7)
Avenida Vista Hermosa (north of I-5)	34	32 (-2)	32 (-2)

Table 6-8 summarizes the year 2010 peak hour ICU results for this alternative, and Table 6-9 summarizes the corresponding peak hour V/C data for the freeway ramps in the study area. The peak hour freeway mainline volumes and V/C ratios for this alternative are listed in Table 6-10. The effect of the La Pata Avenue extension and the arterial south of Oso Parkway mitigates the following year 2010 short-range intersection impacts:

27. Rancho Viejo & Ortega (San Juan Capistrano)
28. La Novia & Ortega (San Juan Capistrano)
30. Camino Capistrano & Del Obispo (San Juan Capistrano)
32. Valle & San Juan Creek (San Juan Capistrano)
33. La Novia & San Juan Creek (San Juan Capistrano)

Similar to the previous alternative circulation system scenario, because the extension of La Pata Avenue allows traffic to travel south to San Clemente and I-5 via the arterial extension, and because of other reorientations in traffic that occur with the extension, the following additional ramp and intersection locations are deficient under this scenario:

Abbreviations: ICU - intersection capacity utilization NB - northbound
LOS - level of service SB - southbound

(a) LOS E is acceptable at this location (Congestion Management Program (CMP) intersections and Crown Valley Parkway intersections between I-5 and Marguerite Parkway). LOS D is the adopted performance standard for all other intersection locations that are analyzed.

(b) This location is forecast to operate deficiently in the AM and/or PM peak hour (i.e., the LOS is worse than the adopted LOS performance standard).

Shaded entries denote impacts compared to no-project conditions. An intersection location is considered impacted when it is forecast to operate at an unacceptable LOS and, compared to no-project conditions, the ICU increases as follows:
0.01 or greater for intersections in the Cities of Mission Viejo, Rancho Santa Margarita and San Juan Capistrano and in unincorporated County of Orange.
Greater than 0.01 for intersections in the Cities of Laguna Hills, Laguna Niguel and San Clemente.

2010 MITIGATION PROGRAM

Table 6-11 summarizes the transportation improvement program proposed as mitigation for the short-range project. The program involves all or part of the improvements identified in the long-range (2025) transportation improvement program in Chapter 5.0, and hence prioritizes those long-range improvements as part of the short-range project. The number of improvements varies depending on the circulation system scenario (i.e., committed, committed plus La Pata Avenue extension, committed plus La Pata Avenue extension and arterial south of Oso Parkway). As footnoted in Table 6-11, under 2010 short-range project conditions based on the committed circulation system without the La Pata Avenue extension or the arterial south of Oso Parkway, the improvements identified at the following intersection locations are not included in the proposed long-range (2025) transportation improvement program:

27. Rancho Viejo & Ortega (San Juan Capistrano)
33. La Novia & San Juan Creek (San Juan Capistrano)

As discussed previously in Chapter 5.0, the proposed mitigation for the I-5/Ortega Highway interchange involves reconstructing the interchange. A traffic study for the interchange reconstruction is currently on-going by the City of San Juan Capistrano and Caltrans and is scheduled for completion by the middle of 2004.

LEVELS OF SERVICE AFTER MITIGATION

Table 6-12 lists the deficient intersection locations under 2010 short-range project conditions and shows the LOS with and without the proposed improvements. Table 6-13 lists the deficient freeway ramps and the LOS with and without the proposed improvements. As the summary tables indicate, the proposed improvements result in acceptable levels of service at each improvement location.

2010 CIRCULATION SYSTEM IMPROVEMENT PROGRAM

Location	Jurisdiction	Improvements	Scenario in which Improvements are Needed (a)		
			1	2	3
FREEWAY INTERCHANGES					
Ortega Hwy/I-5 Interchange	Caltrans	Reconstruct interchange: design to be determined by Caltrans.	X	X	X
FREEWAY RAMPS					
I-5 southbound off-ramp at Oso Pkwy	Caltrans	Add second drop lane from I-5 to the off-ramp.	X		X
I-5 southbound off-ramp at Crown Valley Pkwy	Caltrans	Add second auxiliary lane from I-5 to the off-ramp.	X	X	X
ARTERIAL ROADS					
La Pata Ave extension	County	Extend as four-lane primary arterial from current terminus south of Ortega Hwy to existing termination point in San Clemente.		X	X
New Ortega Hwy (Antonio Pkwy east into the project site)	County	Construct four/six lane roadway.	X (c)	X (c)	X (c)
INTERSECTIONS					
4. Felipe Rd & Oso Pkwy	Mission Viejo	Add second southbound left-turn lane.	X	X	X
5. Antonio Pkwy & Oso Pkwy	County	Add fourth southbound through lane, and provide eastbound right-turn overlap with the northbound left-turn movement and northbound right-turn overlap with the westbound left-turn movement.	X	X	X
		Add third northbound left-turn lane.	X	X	
11. Marguerite Pkwy & Crown Valley Pkwy	Mission Viejo	Committed improvements (Ladera Ranch): add fourth eastbound and westbound through lanes, second northbound, southbound and westbound left-turn lanes, northbound right-turn lane, and convert southbound free right-turn lane to a standard right-turn lane.	X (d)	X (d)	X (d)
		Convert second southbound through lane to shared second through/ second right-turn lane, and add a de-facto westbound right-turn lane.	X	X	X
12. Antonio Pkwy & Crown Valley Pkwy	County	Convert second eastbound through lane to a third left-turn lane and add a second eastbound right-turn lane.	X	X	X
		Add a third northbound left-turn lane.		X	
27. Rancho Viejo Rd & Ortega Hwy	San Juan Capistrano	Convert eastbound right-turn lane to shared third through/right-turn lane.	X (b)		
28. La Novia Ave & Ortega Hwy	San Juan Capistrano	Add second westbound left-turn lane.	X		

Table 6-11 (cont)
2010 CIRCULATION SYSTEM IMPROVEMENT PROGRAM

Location	Jurisdiction	Improvements	Scenario in which Improvements are Needed (a)		
			1	2	3
29. Antonio Pkwy-La Pata Ave & Ortega Hwy	County	Committed improvements (County of Orange): add second eastbound left-turn lane.	X (d)	X (d)	X (d)
		Add southbound free right-turn lane.	X	X	X
		Add second northbound through lane.		X	X
30. Cm Capistrano & Del Obispo St	San Juan Capistrano	Convert southbound right-turn lane to shared second through/right-turn lane, and add second westbound left-turn lane.	X		
32. Valle Rd & San Juan Creek Rd	San Juan Capistrano	Add second westbound through lane.	X		
33. La Novia Ave & San Juan Creek Rd	San Juan Capistrano	Add second eastbound left-turn lane.	X (b)		
37. Avd La Pata & Avd Vista Hermosa	San Clemente	Add second eastbound left-turn lane.		X	X
43. Antonio Pkwy & New Ortega Hwy	County	Construct intersection and provide the following lanes: one northbound left-turn lane, three northbound through lanes, and a northbound free right-turn lane, two southbound left-turn lanes, three southbound through lanes, and a de-facto southbound right-turn lane, two westbound left-turn lanes, one westbound through lane, and a westbound free right-turn lane, one eastbound left-turn lane, one eastbound through lane, and one eastbound right-turn lane.	X	X	X
56. I-5 southbound ramps & Avd Pico	San Clemente	Convert second westbound through lane to shared second left-turn/ through lane.		X	X
59. SR-241 northbound ramps & Antonio Pkwy	Rancho Santa Margarita	Convert third westbound through lane to shared third through/second right-turn lane.	X	X	X

(a) The background circulation system assumptions for each scenario are as follows:
Scenario 1: Committed circulation system.
Scenario 2: Committed circulation system with La Pata Avenue extension.
Scenario 3: Committed circulation system with La Pata Avenue extension and arterial road south of Oso Parkway at SR-241.

(b) The improvements listed at this location are not required in the long-range (2025) mitigation program for the project.

(c) In the 2010 scenarios, New Ortega Highway is only assumed to extend east of Antonio Parkway into the project site and not to Old Ortega Highway.

(d) These committed improvements are assumed to be constructed by others by year 2010.

Chapter 7.0
PROJECT ALTERNATIVES

This chapter discusses alternatives to the proposed project. They represent different amounts and distribution of land use development within the project area and hence have different traffic impacts than the proposed project.

OVERVIEW

Nine project alternatives are discussed in this chapter. They are briefly summarized below and more detailed descriptions are given later in this chapter under the discussions on individual alternatives.

1. A-1: No Project – No development in the project area

2. A-2: Current County General Plan Zoning (Existing Zoning) – This alternative would have 3,265 dwellings in the project area (one unit per four acres in the developable parts of the project area)

3. A-3: OCP-2000 Demographic Data – These projections are part of the Orange County Demographic database used for Countywide planning, and show 20,500 dwelling units and 9,800 employees for the project area.

4. B-4 Reduced Intensity – This alternative is a reduced intensity alternative with 10,800 dwelling units and 8,784 employees.

5. B-5 Alternative – This alternative concentrates the development in the more northerly parts of the project (i.e., no development in Planning Areas 6 through 10). It has 14,000 dwelling units and 16,895 employees, the same as the proposed project.

6. B-6 Alternative – This alternative has 14,000 dwelling units and 16,895 employees, the same as the proposed project, but with no development in Planning Areas 2, 10 and 12.

7. B-8 Alternative – This reduced intensity alternative has 8,400 dwelling units and 7,731 employees, with development concentrated in Planning Areas 1, 3 and 5.

8. Regional Housing – This alternative has 19,200 dwelling units and 11,569 employees and provides additional housing and employment compared to the proposed project.

9. County Constrained – This alternative has 14,450 dwelling units and 17,563 employees.

ANALYSIS SCENARIOS

A detailed traffic analysis was carried out for six of the nine land use alternatives. For the three alternatives that were not analyzed in detail, a trip generation estimate was prepared and a finding made that the particular alternative would not be measurably different from one of the fully analyzed alternatives.

Table 7-1 lists the trip generation for each alternative and provides a comparison against the proposed project. Detailed land use data and trip generation for all nine alternatives is presented in Appendix A. A full traffic analysis was carried out for the six alternatives noted in the table, and a discussion of the results is presented in this chapter. The three alternatives that were not included in the full analysis are as follows:

B-6 Alternative: The land use distribution and project trip generation is minimally different from the proposed project and would show the same cumulative impact results.

B-8 Alternative: The cumulative impacts of this alternative would be similar to the B-4 Reduced Intensity alternative for most of the study area since the trip generation is generally the same. In the southernmost part of the study area (i.e., the southeastern part of San Clemente), the impacts would be the same as for the B-5 Alternative which also features no land use in the southern part of the project area.

County Constrained: The land use distribution and project trip generation for this alternative is minimally different from the proposed project and would show the same cumulative impact results.

For the six alternatives that are analyzed in detail, the land use is paired with one or more circulation system alternatives. The combination of land use and transportation system creates an analysis "scenario." Land uses outside the project area are the same for all scenarios, and with the exception of the Existing Zoning and OCP-2000 alternatives, the on-site circulation is the same for every scenario (the existing zoning and OCP-2000 alternatives assume the current MPAH on-site, while all other alternatives assume the proposed MPAH amendments on-site).

Table 7-1

LAND USE AND TRIP GENERATION SUMMARY - PROJECT ALTERNATIVES

Alternative	AM Peak Hour			PM Peak Hour			ADT
	In	Out	Total	In	Out	Total

B-6 Alternative	6,976	7,398	14,375	9,093	9,007	18,100	183,906
B-8 Alternative	4,223	5,852	10,075	6,734	5,594	12,327	126,925
Regional Housing*	6,406	8,063	14,469	9,908	8,794	18,702	191,911
County Constrained	6,768	7,555	14,323	9,183	8,821	18,004	183,360

Note: Detailed land use information on each alternative can be found in Appendix A.

* Detailed traffic analysis results for these alternatives are given in this chapter.

Abbreviations: DU – dwelling unit
ADT – average daily trips generated

The 11 scenarios analyzed here can be seen in Table 7-2. All scenarios are analyzed for 2025 cumulative conditions, and the following sections discuss the cumulative impact results for these 11 scenarios.

CUMULATIVE IMPACTS – PROJECT ALTERNATIVES

Year 2025 ADT diagrams and supporting traffic forecast data for the 11 project alternative scenarios can be found in Appendix B. Table 7-3 provides a master impact table which summarizes cumulative deficiencies for the mainline freeway, freeway ramps and intersections in the study area. Shaded entries denote locations where there is a deficiency. These can be compared with the same information for the cumulative setting with proposed project in Chapter 4.0. As a basis for the comparison discussion that follows, the number of deficiencies for the proposed project under 2025 cumulative conditions are as follows:

Circulation System Component	Number of Deficient Locations		
	Committed Circulation System	Committed with La Pata	Committed with La Pata and FTC-S
Freeway Mainline	7	7	4
Freeway Ramps	7	5	5
Intersections	19	16	12

The following sections discuss the cumulative analysis results for each alternative with emphasis on how each alternative would affect these deficiencies.

No Project

This alternative assumes no development in the Ranch Plan area and is paired with the committed circulation system. The intent of this alternative is to serve as a benchmark for comparison against other scenarios. As can be seen in the previously referenced master impact table, there are seven mainline freeway deficiencies, seven freeway ramp deficiencies and 15 deficient intersections under this scenario.

Existing Zoning

This scenario examines the current County General Plan zoning which would enable a total of 3,265 dwelling units to be built over the Ranch Plan area. This land use would generate approximately

* Buildout of the Orange County Master Plan of Arterial Highways (MPAH) includes the Foothill Transportation Corridor South (FTC-S).

□ - No deficiency at this location.
■ - Deficiency at this location.

30,000 trips per day. Two circulation scenarios for this land use are analyzed, one being the committed system and the other being the full MPAH including the FTC-S.

As indicated in the master impact table, under the committed network scenario this alternative would have seven mainline freeway deficiencies, eight freeway ramp deficiencies and 19 intersection deficiencies. The MPAH circulation system with existing zoning land use, by comparison, results in four mainline freeway deficiencies, four freeway ramp deficiencies and five intersection deficiencies.

OCP-2000 Demographic Data

The OCP-2000 demographic data for the County of Orange assumes development of the project area with 20,468 dwelling units and 9,800 total employees. As shown earlier, this alternative is expected to generate approximately 236,000 average daily trips, substantially more than the 183,300 for the proposed project.

This alternative was analyzed using the MPAH network (both on-site and off-site) including the FTC-S. Under this scenario, the OCP-2000 alternative results in four mainline freeway deficiencies, seven freeway ramp deficiencies and 12 intersection deficiencies.

B-4 Reduced Intensity Alternative

This alternative is a reduced intensity version of the proposed project. Proposed development includes 10,800 dwelling units and about two million square feet of non-residential land uses. It is estimated to generate approximately 135,000 daily trips and is evaluated under the committed network, the committed plus La Pata Avenue, and committed plus La Pata Avenue and FTC-S circulation systems.

The B-4 Reduced Intensity alternative under the committed circulation system results in seven mainline freeway deficiencies, seven freeway ramp deficiencies and 19 intersection deficiencies. Under the committed plus La Pata Avenue circulation system, the mainline deficiencies remain the same (seven), the freeway ramp deficiencies reduce to five, and there are 15 intersection deficiencies. The committed plus La Pata Avenue and FTC-S circulation system results in the least number of deficiencies

for this land use plan (four mainline freeway deficiencies, four freeway ramp deficiencies and 10 intersection deficiencies).

B-5 Alternative

The B-5 alternative is similar to the proposed project but concentrates the project development in the northern areas, placing no development in Planning Areas 4 and 6 through 9. It is estimated to generate approximately 183,900 daily trips, the same as the proposed project. This alternative is evaluated under three different circulation systems: committed, committed plus La Pata Avenue, and committed plus La Pata Avenue and FTC-S.

The B-5 alternative under the committed circulation system results in seven mainline freeway deficiencies, five freeway ramp deficiencies and 19 intersection deficiencies. Under the committed plus La Pata Avenue circulation system, the mainline and ramp deficiencies remain the same (seven and five, respectively), and there are 18 intersection deficiencies. The committed plus La Pata Avenue and FTC-S circulation system results in three mainline freeway deficiencies, four freeway ramp deficiencies and 14 intersection deficiencies.

Regional Housing Alternative

The Regional Housing alternative assumes development of the project area with 19,200 dwelling units and 11,569 total employees. Seniors housing comprises 11,450 of the total dwelling units (compared to 6,000 for the proposed project). Total trip generation is estimated at 191,900 trips (compared to 184,000 for the proposed project). The on-site circulation is the same as for the proposed project. This alternative was analyzed based on the committed network plus La Pata Avenue and FTC-S circulation system.

Since this alternative has a higher trip generation than the proposed project and represents a different development concept for the project area, the cumulative analysis results for this alternative were not included in the master impact table presented earlier. Of primary interest is whether this alternative would require additional mitigation than the proposed project, and Table 7-4 provides a comparison of the 2025 deficiencies for the proposed project versus this Regional Housing Alternative,

□ - No deficiency at this location.
■ - Deficiency at this location.

both based on the committed network plus La Pata Avenue and FTC-S. As can be seen, this alternative results in four mainline freeway deficiencies, five freeway ramp deficiencies and 13 intersection deficiencies. This is similar to the deficiencies for the proposed project, although there is some variation in the actual locations of the intersection deficiencies.

SUMMARY OF FINDINGS – PROJECT ALTERNATIVES

The following summarizes the key findings from the analysis of the project alternatives.

Freeway Mainline

Deficiencies on the freeway mainline are minimally affected by the intensity of land use on the project site. For example, with the committed network, the same seven locations are deficient for the 30,000 ADT existing zoning scenario as for the 184,000 ADT proposed project. The addition of the FTC-S reduces these deficiencies to three or four, again irrespective of project area land use.

Freeway Ramps

The freeway ramp analysis shows between four and eight locations being impacted, the differences being partly attributable to the amount and distribution of project land use and partly to the regional circulation system (e.g., with FTC-S versus no FTC-S).

Intersections

The intersection deficiencies are affected both by the amount and distribution of project land uses and by the regional circulation system. For example, the proposed project cumulative setting results in 19 deficient locations under the committed circulation system, and 12 with the addition of La Pata and FTC-S. The corresponding deficiencies for the reduced intensity alternative are 19 and 10, respectively. Other alternatives such as B-5 (19 and 14 deficiencies, respectively) generally fit within this envelope of intersection deficiencies. The cumulative setting with no development on the project area shows 15 intersection deficiencies under the committed system.

Mitigation

As was shown in Chapter 6.0, the cumulative impacts with the proposed project are mitigated by an overall transportation improvement program for the study area. An evaluation of the intersection improvements proposed in relation to the project alternative indicates that some of the improvements would not be needed with alternative land uses. The results are summarized in Table 7-5 in the form of an intersection deficiency listing by alternative. The locations included here are those that are deficient in the cumulative with project setting and which are therefore addressed in the mitigation program. Mitigation would not be required at locations that are not deficient under a given alternative.

EXISTING ZONING BASELINE COMPARISON

The "Environmental Baseline" for EIR purposes is existing conditions (April, 2003). In accordance with CEQA requirements, the analysis then evaluates existing plus project conditions and identifies project impacts in relation to that no-project baseline. Cumulative development is then added to the existing plus project to give existing plus project plus cumulative conditions. This is the 2025 analysis presented in the second part of Chapter 4.0. As discussed there, growth projections for year 2025 are used to represent cumulative growth. Mitigation measures for this 2025 cumulative scenario are then identified as summarized in Chapter 5.0.

The project alternatives examined here in Chapter 7.0 use the same 2025 time frame, providing information for a number of existing plus project plus cumulative scenarios. The primary purpose is to identify the extent to which the mitigation measures would be different (e.g., not needed) under each project alternative.

Since the proposed project requires a General Plan Amendment (GPA), a comparison between the existing General Plan (referred to here as the "General Plan Baseline") and the proposed project shows the impact of the GPA in a long-range cumulative setting. Two networks are used for this comparison, the existing circulation system plus improvements that are committed by 2025 and MPAH buildout. The latter is the General Plan Circulation Element of the County, but since the committed network is also used for some of the traffic analysis material presented in this traffic report, comparative material for committed network conditions is also summarized here. The General Plan Baseline assumes the MPAH

* Buildout of the Orange County Master Plan of Arterial Highways (MPAH) includes the Foothill Transportation Corridor South (FTC-S).

□ - No deficiency at this location.
■ - Deficiency at this location.

(a) Although a deficiency is not forecast at this location, operational considerations indicate that the level of service based on intersection capacity utilization (ICU) values is not achieved. Therefore, improvements at this location are needed as mitigation under this alternative scenario.

roadway network for all of the study area including the project site. Development assumptions are for 3,265 dwelling units with corresponding trip generation as discussed earlier in this chapter. For the proposed project, the MPAH amendments proposed as part of the project are used as the project site network assumptions.

Figure 7-1 shows the 2025 ADT volumes for the existing zoning with the committed network. The corresponding volumes with the proposed project can be found in Chapter 4.0 and for comparison purposes, the volume differences are illustrated in Figure 7-2.

The existing zoning with the current MPAH network (General Plan Baseline) 2025 ADT volumes are shown in Figure 7-3. The corresponding volumes with the proposed project can be found later in Chapter 8.0, and volume differences are illustrated in Figure 7-4.

The 2025 ICU values for the two sets of comparisons are summarized in Tables 7-6 and 7-7. The first table is for the committed network and the second for the MPAH network. A summary of those locations impacted by the proposed project is provided in Table 7-8 along with comparative data from the existing plus project analysis presented earlier in Chapter 4.0. The locations listed here are those that would be impacted by applying the significance criteria. A designation is then made as to whether the deficiency is a result of the project ("PI" for "Project Impact") or whether the project contributes to an existing or baseline deficiency ("CI" for "Contributing Impact").

LONG-RANGE ANALYSIS SUMMARY

The information presented in this report has analyzed project impacts in relation to the Environmental Baseline (existing conditions) and also analyzed long-range cumulative conditions for a number of project alternatives. One of those alternatives was the General Plan Baseline, and the previous section compared that with the proposed project.

Abbreviations: ICU - intersection capacity utilization
LOS - level of service
NB - northbound
SB - southbound

(a) LOS E is acceptable at this location (Congestion Management Program (CMP) intersections and Crown Valley Parkway intersections between I-5 and Marguerite Parkway). LOS D is the adopted performance standard for all other intersection locations that are analyzed.

(b) This location is forecast to operate deficiently in the AM and/or PM peak hour (i.e., the LOS is worse than the adopted LOS performance standard).

Note: An intersection location is considered to be impacted when it is forecast to operate at an unacceptable LOS and, compared to existing zoning conditions, the ICU increases as follows:
0.01 or greater for intersections in the Cities of Mission Viejo, Rancho Santa Margarita and San Juan Capistrano and in unincorporated County of Orange.
Greater than 0.01 for intersections in the Cities of Laguna Hills, Laguna Niguel and San Clemente.

Shaded entries denote impacts compared to the base case (existing zoning with committed circulation system).

85. D St & Ortega	.48	A	.56	A	--	--	--	--

Abbreviations: ICU - intersection capacity utilization
LOS - level of service
NB - northbound
SB - southbound

(a) LOS E is acceptable at this location (Congestion Management Program (CMP) intersections and Crown Valley Parkway intersections between I-5 and Marguerite Parkway). LOS D is the adopted performance standard for all other intersection locations that are analyzed.

(b) This location is forecast to operate deficiently in the AM and/or PM peak hour (i.e., the LOS is worse than the adopted LOS performance standard).

Note: An intersection location is considered to be impacted when it is forecast to operate at an acceptable LOS and, compared to existing zoning conditions, the ICU increases as follows:
0.01 or greater for intersections in the Cities of Mission Viejo, Rancho Santa Margarita and San Juan Capistrano and in unincorporated County of Orange.
Greater than 0.01 for intersections in the Cities of Laguna Hills, Laguna Niguel and San Clemente.

Shaded entries denote impacts compared to the base case (existing zoning with MPAH buildout).

Abbreviations: PI - Project Impact CI - Contributing Impact

* Committed improvements are assumed to be implemented at these locations by 2025, resulting in 2025 ICUs that may be lower than existing plus project.

Four scenarios from previous sections of this report are summarized here to allow a comparison between the following sets of intersection data:

Existing (2003) Conditions
2025 No Project (Committed Circulation System)
2025 Proposed Project (Committed Circulation System)
2025 Proposed Project with Proposed Mitigation

The fourth scenario shows the results of the proposed mitigation program for those locations where improvements are proposed, and contains the same data as summarized at the end of Chapter 5.0. Tables 7-9 through 7-11 summarize the levels of service on intersections, freeway ramps and freeway mainline segments in the study area for the four scenarios. The purpose here is to enable the performance of the various circulation system components to be compared from existing to future, with and without the project and with mitigation. Note that several intersection locations have committed improvements, and the comparison between existing and 2025 includes the effect of such improvements.

Abbreviations: ICU - intersection capacity utilization LOS - level of service

(a) LOS E is acceptable at this location (Congestion Management Program (CMP) intersections and Crown Valley Parkway intersections between I-5 and Marguerite Parkway). LOS D is the adopted performance standard for all other intersection locations that are analyzed.

(b) This location currently operates or is forecast to operate deficiently in the AM and/or PM peak hour (i.e., the LOS is worse than the adopted LOS performance standard).

(c) Committed improvements are assumed to be in place at this intersection under 2025 No Project and Propose Project conditions.

(d) The La Pata Avenue extension eliminates the deficiency that is forecast at this intersection under 2025 Proposed Project conditions.

(e) With mitigation, this intersection is forecast to operate at an unacceptable LOS under 2025 Proposed Project conditions with or without the Foothill Transportation Corridor South (FTC-S).

(f) With mitigation, this intersection is forecast to operate at an unacceptable LOS under 2025 Proposed Project conditions without the FTC-S (this intersection is forecast to operate at an acceptable LOS under 2025 Proposed Project conditions with the FTC-S).

Abbreviations: LOS – level of service V/C – volume/capacity ratio

(a) This location currently operates or is forecast to operate deficiently in the AM and/or PM peak hour (i.e., the LOS is worse than the adopted LOS E performance standard).

(b) The La Pata Avenue extension eliminates the deficiency that is forecast at this ramp under 2025 Proposed Project conditions.

(c) The deficiency at this ramp is addressed with the reconstruction of the Ortega Highway/I-5 interchange, which is included in the long-range mitigation program that is proposed for the project.

Chapter 8.0
SPECIAL ISSUES

This chapter discusses a number of special issues in the study area. They involve specific transportation analyses which depict potential conditions not directly covered in the previous chapters.

MPAH AMENDMENTS

The proposed project includes specific changes to the Orange County Master Plan of Arterial Highways (MPAH). These changes are described in Chapter 3.0 under the project description. To evaluate these proposed amendments to the MPAH, long-range (2025) traffic forecasts with the proposed project land uses are presented here for two scenarios, one based on buildout of the current MPAH and the other based on buildout of the MPAH with the proposed MPAH amendments.

Figures 8-1 and 8-2 show the 2025 average daily traffic (ADT) volumes for the two MPAH buildout scenarios, and Table 8-1 summarizes the corresponding peak hour intersection capacity utilization (ICU) values. As the ADT illustrations indicate, the proposed MPAH amendments result in moderately reduced volumes on Crown Valley Parkway, Ortega Highway and San Juan Creek Road between I-5 and Antonio Parkway/La Pata Avenue, and moderately increased volumes on Oso Parkway. Table 8-2 summarizes the 10 peak hour intersection deficiencies that are forecast under the two MPAH buildout scenarios. Eight of the ten intersections are deficient under both of the MPAH buildout scenarios, one location (Los Altos and Crown Valley Parkway) is deficient only under the scenario that is based on buildout of the current MPAH, and one location (Antonio Parkway and New Ortega Highway) is deficient only under the scenario that is based on buildout of the MPAH with the proposed MPAH amendments.

CALTRANS TRAFFIC SHARES

Guidelines prepared by Caltrans for analyzing the traffic impacts of land use developments contain a number of specific requirements. Most of those are included in the overall impact methodology used throughout this report. One component of the guidelines not directly addressed is a section on traffic

LOS – level of service

(a) LOS E is acceptable at this location (Congestion Management Program (CMP) intersections and Crown Valley Parkway intersections between I-5 and Marguerite Parkway). LOS D is the adopted performance standard for all other intersection locations that are analyzed.

(b) This location is forecast to operate deficiently in the AM and/or PM peak hour (i.e., the LOS is worse than the adopted LOS performance standard).

shares (Caltrans guidelines Appendix B). The introductory sentence states "The methodology below is neither intended as, nor does it establish, a legal standard for determining equitable responsibility and cost of a project's impact." Hence, the share data is informational in nature, and has been included here in accordance with the calculation methodology in the Caltrans guidelines (the same formula as used in the transportation improvement shares summarized in Chapter 6.0).

The share data for I-5 and the State Route 73 (SR-73) toll road can be seen in Table 8-3. The information is for the cumulative with-project scenario with proposed mitigation, and was derived by comparing the 2025 no-project volumes with the with-project volumes and equating that increment to the growth in traffic on I-5 and SR-73.

CALTRANS INTERSECTIONS

The above referenced Caltrans guidelines indicates a preference for evaluating level of service (LOS) at Caltrans intersections using the Highway Capacity Manual (HCM) methodology. This requires information on signal timing and related parameters and for that reason is not typically used in Orange County for long-range planning.

Table 8-4 summarizes the HCM LOS results for Caltrans intersections based on 2025 cumulative with project conditions with La Pata Avenue and the FTC-S and with project mitigation. The HCM calculations have been prepared using representative assumptions for future signal operation, thereby providing comparative results to ICU LOS values. As can be seen, the HCM derived LOSs are reasonably consistent with the corresponding ICU LOSs (the HCM LOS worksheets for the intersections listed in Table 8-4 are included in Appendix D and the corresponding ICU worksheets are included in Appendix C).

AVERY PARKWAY EXTENSION

The City of San Juan Capistrano prepared a Strategic Transportation Plan in 2003 (see Reference 6 in Chapter 1.0) which outlined a number of potential long-range transportation improvements in and around the City. One of the alternatives considered was an eastward extension of the existing section of

Abbreviations: HCM – Highway Capacity Manual
ICU – intersection capacity utilization
LOS – level of service
NB – northbound
SB – southbound

(a) LOS E is acceptable at this location (Congestion Management Program (CMP) intersections and Crown Valley Parkway intersections between I-5 and Marguerite Parkway). LOS D is the adopted performance standard for all other intersection locations that are analyzed.

Avery Parkway in the City of Mission Viejo to New Ortega Highway east of Antonio Parkway, and it was concluded that the Avery Parkway extension would result in lower future volumes on Ortega Highway.

To evaluate this alternative, traffic forecasts that include the Avery Parkway extension are presented here for two scenarios, one based on the committed network and the other based on the committed network plus La Pata Avenue and the FTC-S. Both scenarios assume the proposed project land uses and the proposed on-site amendments to the MPAH. Figures 8-3 and 8-4 show the 2025 ADT volumes for the two scenarios with the Avery Parkway extension, and Table 8-5 summarizes the corresponding peak hour ICU values. A comparison of these ADT results with the corresponding 2025 cumulative scenarios presented earlier in Chapter 4.0 without the Avery Parkway indicates that the extension reduces traffic volumes on Oso Parkway, Crown Valley Parkway and Ortega Highway.

Table 8-6 summarizes the peak hour intersection deficiencies that are forecast under the 2025 cumulative settings with and without the Avery Parkway extension. Most of the intersection locations that are forecast to operate deficiently without the Avery Parkway extension show some amount of improvement even though they may remain deficient with the Avery Parkway extension. However, the traffic that utilizes the Avery Parkway extension worsens the peak hour deficiencies that are forecast at the Marguerite Parkway/Avery Parkway and Antonio Parkway/New Ortega Highway intersections and results in new peak hour deficiencies at the northbound and southbound ramp intersections at Avery Parkway and at the intersection of C Street and New Ortega Highway.
